

MAT1002 Final Exam Reference Solution

1. T, F, F (e.g. $u_n = (-1)^{n+1} \frac{1}{n}$) 2 pt each;
(6) no partial marks.

2. (i) 2.

(27) (ii) They are spheres of the form $x^2 + y^2 + z^2 = 4 - \frac{1}{k^2}$, 2 pts
 $k \geq \frac{1}{2}$ 1 pt

(iii) Along C , $\frac{dH}{dt}\big|_{t=0} = f_x \frac{dx}{dt} + f_y \frac{dy}{dt} + f_z \frac{dz}{dt} + f_t \big|_{t=0}$.

or at $(x(0), y(0), z(0), 0)$

(iv) 1.

(v) $\langle -\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}} \rangle$ has to be normalized

(vi) $\frac{1}{\sqrt{2}}x^2 - \frac{1}{4\sqrt{2}}x^3 + \frac{3}{32\sqrt{2}}x^4$

(vii) $-\langle 38, 6, 12 \rangle$ (which is $-\nabla H(3, 4, 5)$).

(Any vector of the form $\alpha \langle 19, 3, 6 \rangle$ with $\alpha \leq 0$ is O.K.)

(viii) $\int_0^{2\pi} \int_0^{\frac{\pi}{2}} \int_{\cos\phi}^{2\cos\phi} \rho^3 \cos\phi \sin\phi \, d\rho \, d\phi \, d\theta$
can swap

No partial marks
except (ii).

(ix) $\frac{2}{3}\pi$. (By symmetry, $\int_C x^2 ds = \int_C y^2 ds = \int_C z^2 ds$;

then $\int_C x^2 ds = \frac{1}{3} \int_C (x^2 + y^2 + z^2) ds = \frac{1}{3} \int_C ds = \frac{1}{3} 2\pi(1)$.)

3. (i) Let $g(x, y, z) = xz^2 - yz + \cos(xy)$. Then

$$\nabla g(x, y, z) = \langle z^2 - y \sin(xy), -z - x \sin(xy), 2xz - y \rangle \quad (1)$$

$$\Rightarrow \nabla g(0, 0, 1) = \langle 1, -1, 0 \rangle \quad (1)$$

M is given by $1(x-0) - 1(y-0) + 0(z-1) = 0$ or

$$x - y = 0. \quad (2)$$

L is given by

$$\langle x, y, z \rangle = \langle 0, 0, 1 \rangle + t \langle 1, -1, 0 \rangle = \langle t, -t, 1 \rangle \quad (2)$$

(or $x = t, y = -t, z = 1, t \in \mathbb{R}$).

(ii) Since $\langle 0, 0, 1 \rangle = \vec{r}(1)$, it suffices to show that

$$\vec{r}'(1) \perp \nabla g(0, 0, 1). \quad \text{reasoning } (2)$$

Since $\vec{r}'(t) = \langle \frac{1}{t}, 1 + \ln t, 1 \rangle$, $\vec{r}'(1) = \langle 1, 1, 1 \rangle$. Then

$$\vec{r}'(1) \cdot \nabla g(0, 0, 1) = \langle 1, 1, 1 \rangle \cdot \langle 1, -1, 0 \rangle = 0, \text{ and}$$

we are done.

(2)

4. No. We show that $\lim_{(x,y) \rightarrow (0,0)} f(x,y) \neq f(0,0)$ by showing that the limit does not exist. For each fixed $k \in \mathbb{R}$, let

$$L_k := \lim_{\substack{(x,y) \rightarrow (0,0) \\ \text{along } y=kx}} f(x,y) = \lim_{x \rightarrow 0} \frac{kx^4}{kx^4 + (k-1)^2 x^2}.$$

If $k \neq 1$, then

$$L_k = \lim_{x \rightarrow 0} \frac{kx^2}{kx^2 + (k-1)^2} = 0.$$

If $k=1$, then

$$L_k = \lim_{x \rightarrow 0} \frac{x^4}{x^4} = 1.$$

• Consider two path test:

②

• Get two different limits by correct

computation: ③

By the two-path test, $\lim_{(x,y) \rightarrow (0,0)} f(x,y)$ does not exist.

• Since $\lim_{(x,y) \rightarrow (0,0)} \text{D.N.E.}$, it is $\neq f(0,0)$,

so not continuous.

①

5. Let $g_1(x, y, z) := x^2 + z^2 - 2$, $g_2(x, y, z) := x + y - 1$.

Then $\nabla g_1 = \langle 2x, 0, 2z \rangle$ and $\nabla g_2 = \langle 1, 1, 0 \rangle$,

which are never parallel and never zero with the constraints.

Solve $\begin{cases} \nabla f = \lambda_1 \nabla g_1 + \lambda_2 \nabla g_2 \\ g_1(x, y, z) = 0 \\ g_2(x, y, z) = 0 \end{cases} \Leftrightarrow \begin{cases} 1 = \lambda_1 2x + \lambda_2 & \textcircled{1} \\ 1 = \lambda_2 & \textcircled{2} \\ 1 = \lambda_1 2z & \textcircled{3} \\ x^2 + z^2 = 2 & \textcircled{4} \\ x + y = 1 & \textcircled{5} \end{cases}$

Have this idea: $\textcircled{2}$

$$\textcircled{2} \Rightarrow \lambda_2 = 1 \Bigg\}_{\textcircled{1}} \Rightarrow \lambda_1 2x = 0. \text{ Since } \lambda_1 \neq 0 \text{ by } \textcircled{3}, \text{ we}$$

have $x=0$. Then

$$\textcircled{5} \Rightarrow \underline{y=1} \quad \& \quad \textcircled{4} \Rightarrow z = \pm\sqrt{2},$$

So $(x, y, z) = (0, 1, \pm\sqrt{2})$. correct sol: $\textcircled{2}$

$f(0, 1, \sqrt{2}) = 1 + \sqrt{2}$ is global maximum $\textcircled{1}$
and $f(0, 1, -\sqrt{2}) = 1 - \sqrt{2}$ is global minimum. $\textcircled{1}$

$$6. (i) \int_0^1 \int_{3y}^3 e^{x^2} dx dy$$

$$= \iint_D e^{x^2} dA$$

This idea: ②

$$D = \{(x, y) : 0 \leq y \leq 1, 3y \leq x \leq 3\}$$

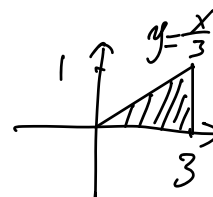

$$= \{(x, y) : 0 \leq x \leq 3, 0 \leq y \leq \frac{x}{3}\}$$

$$= \int_0^3 \int_0^{\frac{x}{3}} e^{x^2} dy dx \quad \textcircled{2}$$

$$= \frac{1}{3} \int_0^3 x e^{x^2} dx$$

$$= \frac{1}{3} \int_0^9 e^u \frac{1}{2} du$$

$$= \frac{1}{6} (e^9 - 1). \quad \textcircled{1}$$

(ii) Let $x = u + v^2$ and $y = v$. Then $u = x - y^2$ and $v = y$. Tried change-of-variable: ①

Since $u=0$ if and only if $x=y^2$, $u=1$ if and only if $x=y^2+1$, and

$$\frac{\partial(u,v)}{\partial(x,y)} = \begin{vmatrix} 1 & -2y \\ 0 & 1 \end{vmatrix} = 1,$$

Remember Jacobian: ①

$$I = \int_0^1 \int_0^1 v(u+v^2)^4 du dv = \int_0^1 \int_{y^2}^{y^2+1} y x^4 dx dy \quad \textcircled{2}$$

$$= \frac{1}{5} \int_0^1 y [y^2+1]^5 - y^{10} dy \stackrel{w=y^2}{=} \frac{1}{10} \int_0^1 (w+1)^5 - w^5 dw$$

$$= \frac{1}{10} \int_0^1 (5w^4 + 10w^3 + 10w^2 + 5w + 1) dw$$

$$= \frac{1}{10} \left(1 + \frac{10}{4} + \frac{10}{3} + \frac{5}{2} + 1 \right) = \frac{1}{10} \left(\frac{12+30+40+30+12}{12} \right) = \frac{31}{30}. \quad \textcircled{1}$$

7. Let D be the region. In polar coordinates.

$$x^2 + y^2 = 1 \Leftrightarrow r = 1,$$

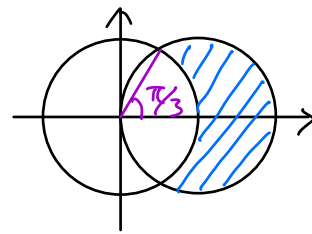

$$(x-1)^2 + y^2 = 1 \Leftrightarrow x^2 + y^2 - 2x = 0$$

$$\Leftrightarrow r^2 - 2r \cos \theta = 0$$

$$\Leftrightarrow r = 2 \cos \theta \quad \text{or} \quad r = 0 \quad (\text{origin}).$$

$$2 \cos \theta = 1 \Leftrightarrow \cos \theta = \frac{1}{2}$$

$$\Leftrightarrow \theta = \pm \frac{\pi}{3}.$$

Now

Explained (see above) :

① pt each

$$\textcircled{1} \quad A(D) = \iint_D dA = \int_{-\frac{\pi}{3}}^{\frac{\pi}{3}} \int_1^{2 \cos \theta} r \, dr \, d\theta$$

$$= \frac{1}{2} \int_{-\frac{\pi}{3}}^{\frac{\pi}{3}} (4 \cos^2 \theta - 1) \, d\theta$$

$$= \int_0^{\frac{\pi}{3}} (4 \cos^2 \theta - 1) \, d\theta$$

$$= \int_0^{\frac{\pi}{3}} [2(1 + \cos 2\theta) - 1] \, d\theta$$

$$= \frac{\pi}{3} + \int_0^{\frac{\pi}{3}} 2 \cos(2\theta) \, d\theta$$

$$= \frac{\pi}{3} + (\sin(2\theta)) \Big|_{\theta=0}^{\frac{\pi}{3}}$$

$$= \frac{\pi}{3} + \frac{\sqrt{3}}{2}. \quad \textcircled{2}$$

8. Consider $z = \pm \sqrt{1 - (x^2 + y^2)^2}$, with domain

$$D = \{(x, y) : x^2 + y^2 \leq 1\}.$$

①

$$\underline{V(E) = \iiint_E dV = \iint_D \int_{-\sqrt{1-(x^2+y^2)^2}}^{\sqrt{1-(x^2+y^2)^2}} dz dA}$$

Cylindrical

$$= \int_0^{2\pi} \int_0^1 \int_{-\sqrt{1-r^4}}^{\sqrt{1-r^4}} r dz dr d\theta \quad \text{②}$$

$$= 2\pi \int_0^1 2r\sqrt{1-r^4} dr$$

$u = r^2$

$$= 2\pi \int_0^1 \sqrt{1-u^2} du$$

$$= 2\pi \int_0^{\frac{\pi}{2}} \sqrt{1-\sin^2\theta} \cos\theta d\theta$$

$$= 2\pi \int_0^{\frac{\pi}{2}} \cos^2\theta d\theta$$

$$= \pi \int_0^{\frac{\pi}{2}} (1 + \cos 2\theta) d\theta$$

$$= \pi \left(\frac{\pi}{2} + \frac{1}{2} \sin(2\theta) \right) \Big|_{\theta=0}^{\frac{\pi}{2}}$$

$$= \underline{\frac{\pi^2}{2}}. \quad \text{②}$$

9. (i) Since \vec{F} is conservative on D , by component test,

$$\frac{\partial N}{\partial x} = \frac{\partial M}{\partial y} \Rightarrow \frac{k}{y} e^{kx} = \frac{e^{kx}}{y} \Rightarrow k=1$$

• Remember the form of the test: $m \cos z = \cos z$ ② $\Rightarrow m=1$ ②

• Mention the test: ①

(ii) By (i), $\vec{F} = \langle e^x \ln y, \frac{e^x}{y} + \sin z, y \cos z \rangle$.

Since \vec{F} is conservative, $\vec{F} = \nabla f$ for some f .

• $f_x = e^x \ln y \Rightarrow f = \int f_x dx = e^x \ln y + K(y, z)$. ①

• By ①, $f_y = \frac{e^x}{y} + \frac{\partial K}{\partial y}(y, z)$. ①

• But $f_y = N = \frac{e^x}{y} + \sin z$, so $\frac{\partial K}{\partial y}(y, z) = \sin z$ and

$$K(y, z) = y \sin z + B(z).$$

• Now ① $\Rightarrow f = e^x \ln y + y \sin z + B(z)$

$$\Rightarrow f_z = y \cos z + B'(z).$$

• But $f_z = P = y \cos z$, so $B'(z) = 0 \Rightarrow B(z) \equiv C$.

One possible potential: $f(x, y, z) = e^x \ln y + y \sin z$. ③

Could have $+C$.

Some intermediate steps: ①

10. (i) By Green's theorem, (1)

$$\oint_C x dy = \oint_C 0 dx + x dy \stackrel{(1)}{=} \iint_R \left(\frac{\partial x}{\partial x} + \frac{\partial 0}{\partial y} \right) dA \stackrel{(1)}{=} \iint_R dA \stackrel{(1)}{=} A(R).$$

(ii) $x = \sqrt{\sin t} \cos t$, $y = \sin^{\frac{3}{2}} t$, $0 \leq t \leq \pi$. (2)

(iii)

$$\begin{aligned} A(R) &= \oint_C x dy = \int_0^\pi \sin^{\frac{1}{2}} t \cos t \cdot \frac{3}{2} \sin^{\frac{1}{2}} t \cos t dt \quad (2) \\ &= \frac{3}{2} \int_0^\pi \sin t \cos^2 t dt \\ &= \frac{3}{2} \int_{-1}^1 (-u)^2 du \\ &= \frac{3}{2} \int_{-1}^1 u^2 du \\ &= 3 \int_0^1 u^2 du \\ &= \underline{1}. \quad (3) \end{aligned}$$

11. The surface S has boundary being the circle

$$\underline{x=2, y=2\cos t, z=2\sin t, 0 \leq t \leq 2\pi,} \quad (2)$$

which is counterclockwise with respect to the given direction of \vec{n} .

By Stokes' theorem, (2)

$$\underline{\iint_S \text{curl}(\vec{F}) \cdot \vec{n} \, d\sigma = \oint_C \vec{F} \cdot d\vec{r} = \oint_C N dy + P dz} \quad (dx=0)$$

$$= \int_0^{2\pi} [8\cos t (-2)\sin t \, dt + 16\sin^2 t \cdot 2\cos t] \, dt$$

$$= \left(-8\sin^2 t + \frac{32}{3}\sin^3 t \right) \Big|_{t=0}^{2\pi} = \underline{0.} \quad (2)$$

(Alternatively, at plane $x=2$, $N=4y$, $P=4z^2$,

$$\oint_C N dy + P dz \stackrel{\text{Green's}}{=} \iint_R \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z} \right) dA = \iint_R 0 \, dA = 0.)$$

12. By the divergence theorem (or Gauss' theorem) :

$$\iint_S \vec{F} \cdot \vec{n} d\sigma = \iiint_E \operatorname{div} \vec{F} dV = \iiint_E \underline{\underline{z^3}} dV$$

① \nwarrow get $\operatorname{div}(\vec{F}) :$

In spherical coordinates:

$$z = \sqrt{\frac{x^2+y^2}{3}} \Leftrightarrow \rho \cos \phi = \frac{\rho \sin \phi}{\sqrt{3}} \Leftrightarrow \tan \phi = \sqrt{3}$$
$$\Leftrightarrow \phi = \frac{\pi}{3}$$

$$I = \iiint_E z^3 dV = \int_0^{2\pi} \int_0^{\frac{\pi}{3}} \int_0^1 \rho^3 \cos^3 \phi \rho^2 \sin \phi d\rho d\phi d\theta$$

$$= 2\pi \left(\int_0^{\frac{\pi}{3}} \cos^3 \phi \sin \phi d\phi \right) \left(\int_0^1 \rho^5 d\rho \right)$$

$$= 2\pi \left(\int_{\frac{1}{2}}^1 u^3 du \right) \frac{1}{6}$$

$$= \frac{1}{3}\pi \left[\frac{1}{4} \left(1 - \frac{1}{16} \right) \right] = \underline{\underline{\frac{5\pi}{64}}}$$

Get the right
form of the
iterated integral:
