

MAT1002 Calculus II

Final Examination

(Spring 2021)

Solution Key:

1. (30 pts)

No partial credits!

- (i) False
- (ii) $\kappa = 1/t$
- (iii) False
- (iv) x
- (v) $\mathbf{i} + 2\mathbf{j}$ which is the negative of the gradient of T at $(0,0)$.
- (vi) False, need D to be simply connected.
- (vii) True
- (viii) (c) is true
- (ix) (a) is true
- (x) $4\mathbf{i} - 2\mathbf{j} + \mathbf{k}$ which is the curl of \mathbf{V} at $(1,1,1)$

2. (8 pts) Let $a_n = (-3)^n x^n / \sqrt{n+1}$, then

$$\left| \frac{a_{n+1}}{a_n} \right| = \left| (-3)x \frac{\sqrt{n}}{\sqrt{n+1}} \right| \rightarrow |3x|$$

as $n \rightarrow \infty$. Hence, when $|x| < 1/3$ the series is absolutely convergent. When $x = -1/3$ it diverges by the p -series results. When $x = 1/3$ it converges (conditionally) by the Alternating Series Test.

① 求出 $|x| < \frac{1}{3}$, (2分)
 ② 求出 $|x| < \frac{1}{3}$ is absolutely convergent (2分)
 ③ $x = -\frac{1}{3}$ 时判断正确 (2分)
 ④ $x = \frac{1}{3}$ 时判断正确 (2分)

3. (6 pts) From

$$\sin x = x - x^3/3! + x^5/5! - x^7/7! + \dots$$

and

$$\cos x = 1 - x^2/2! + x^4/4! - x^6/6! + \dots$$

we have

$$2x^2(1 - \cos(x^2)) - x^6 = 2x^2(x^4/2! - x^8/4! + x^{12}/6! + \dots) - x^6 = -x^{10}/12 + O(x^{14})$$

and

$$\sin x^{10} = x^{10} + O(x^{30}).$$

So as $x \rightarrow 0$,

$$\frac{(2x^2(1 - \cos(x^2)) - x^6)}{\sin x^{10}} = \frac{-x^{10}/12 + O(x^{14})}{x^{10} + O(x^{30})} \rightarrow -1/12.$$

4. (12 pts)

(a) $\vec{BA} = \langle 1, -1, 5 \rangle$, $\vec{BC} = \langle 0, 2, 4 \rangle$. So the cosine of $\angle ABC$ is given by

$$\frac{\vec{BA} \cdot \vec{BC}}{|\vec{BA}| |\vec{BC}|} = \frac{0 - 2 + 20}{\sqrt{27} \sqrt{20}} = \frac{\sqrt{3}}{5}.$$

(b) The vector projection of \vec{BA} onto \vec{BC} is given by

$$\frac{\vec{BA} \cdot \vec{BC}}{|\vec{BC}|^2} \vec{BC} = \frac{18}{20} \langle 0, 2, 4 \rangle = \frac{9}{5} \langle 0, 1, 2 \rangle.$$

(c) The area of the parallelogram is given by $|\vec{BA} \times \vec{BC}|$, which is

$$\text{the modulus of } \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -1 & 5 \\ 0 & 2 & 4 \end{vmatrix} = | \langle -14, -4, 2 \rangle | = \sqrt{196 + 16 + 4} = \sqrt{216}.$$

(d) As $\vec{BA} \times \vec{BC} = \langle -14, -4, 2 \rangle$ and $B = (1, 0, -1)$, the plane containing the parallelogram is given by

$$0 = (x - 1)(-14) + y(-4) + (z + 1)2$$

which is

$$7x + 2y - z = 8.$$

5. (15 pts)

Let $F(x, y, z) = \cos(\pi yz) + 4xz^2$, then S is a level surface of F .

(a)
$$\nabla F = \langle 4z^2, -\pi z \sin(\pi yz), -\pi y \sin(\pi yz) + 8xz \rangle$$

and

$$\nabla F(1/2, 1, -1) = \langle 4, 0, -4 \rangle.$$

So the tangent plane at $(1/2, 1, -1)$ is given by

$$0 = (x - 1/2)4 + (z + 1)(-4) = 4x - 4z - 6$$

which is

$$2x - 2z - 3 = 0.$$

(b) For $z = f(x, y)$, we have

$$F_x(1/2, 1, -1) = (4z^2)|_{(1/2, 1, -1)} = 4,$$

$$F_y(1/2, 1, -1) = (-\pi z \sin(\pi yz))|_{(1/2, 1, -1)} = 0,$$

$$F_z(1/2, 1, -1) = (-\pi y \sin(\pi yz) + 8xz)|_{(1/2, 1, -1)} = -4,$$

$$f_x(1/2, 1) = \frac{-F_x(1/2, 1, -1)}{F_z(1/2, 1, -1)} = \frac{-4}{-4} = 1$$

and

$$f_y(1/2, 1) = \frac{-F_y(1/2, 1, -1)}{F_z(1/2, 1, -1)} = 0.$$

So for $\mathbf{v} = 2\mathbf{i} - \mathbf{j}$, the directional derivative is

$$D_{\frac{\mathbf{v}}{|\mathbf{v}|}} f(1/2, 1) = \nabla f(1/2, 1) \cdot \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{1}{\sqrt{5}} \langle 1, 0 \rangle \cdot \langle 2, -1 \rangle = \frac{2}{\sqrt{5}}.$$

(c) A normal vector to the level curve $f(x, y) = -1$ at $(1/2, 1)$ is $\nabla f(1/2, 1) = \mathbf{i}$. So the tangent line to the level curve at $(1/2, 1)$ is given by

$$1(x - \frac{1}{2}) + 0(y - 1) = 0 \implies x = \frac{1}{2},$$

which is a straight line on the xy -plane. Putting the level curve back to the plane $z = -1$, we have the contour curve. So the desired tangent line has parametric equations:

$$x = \frac{1}{2}, \quad y = t, \quad z = -1,$$

for $-\infty < t < \infty$.

6. (9 pts) Given a fixed $(x, y) \in R$, define

$$F(t) = f(tx, ty), \quad \text{for } t \in [0, 1].$$

Using Taylor's theorem for functions of a single variable, there is a $c \in (0, 1)$ so that

$$F(1) = F(0) + F'(0) + F''(c)/2!.$$

Since

$$F'(0) = xf_x(0, 0) + yf_y(0, 0)$$

and

$$F''(c) = x^2 f_{xx}(cx, cy) + 2xy f_{xy}(cx, cy) + y^2 f_{yy}(cx, cy),$$

$$f(x, y) = f(0, 0) + xf_x(0, 0) + yf_y(0, 0) + \frac{1}{2}[x^2 f_{xx}(cx, cy) + 2xy f_{xy}(cx, cy) + y^2 f_{yy}(cx, cy)].$$

7. (8 pts) By Lagrange's method, we first solve

$$1 = 2\lambda x \implies x = \frac{1}{2\lambda},$$

$$2 = 2\lambda y \implies y = \frac{1}{\lambda},$$

$$5 = 2\lambda z \implies z = \frac{5}{2\lambda}.$$

Substituting them into the constraint $x^2 + y^2 + z^2 = 1$, we have

$$\lambda^2 = (1/2)^2 + (1)^2 + (5/2)^2 = \frac{1}{4} + 1 + \frac{25}{4} = \frac{15}{2},$$

so

$$\lambda = \pm \sqrt{15/2}$$

and the corresponding points are

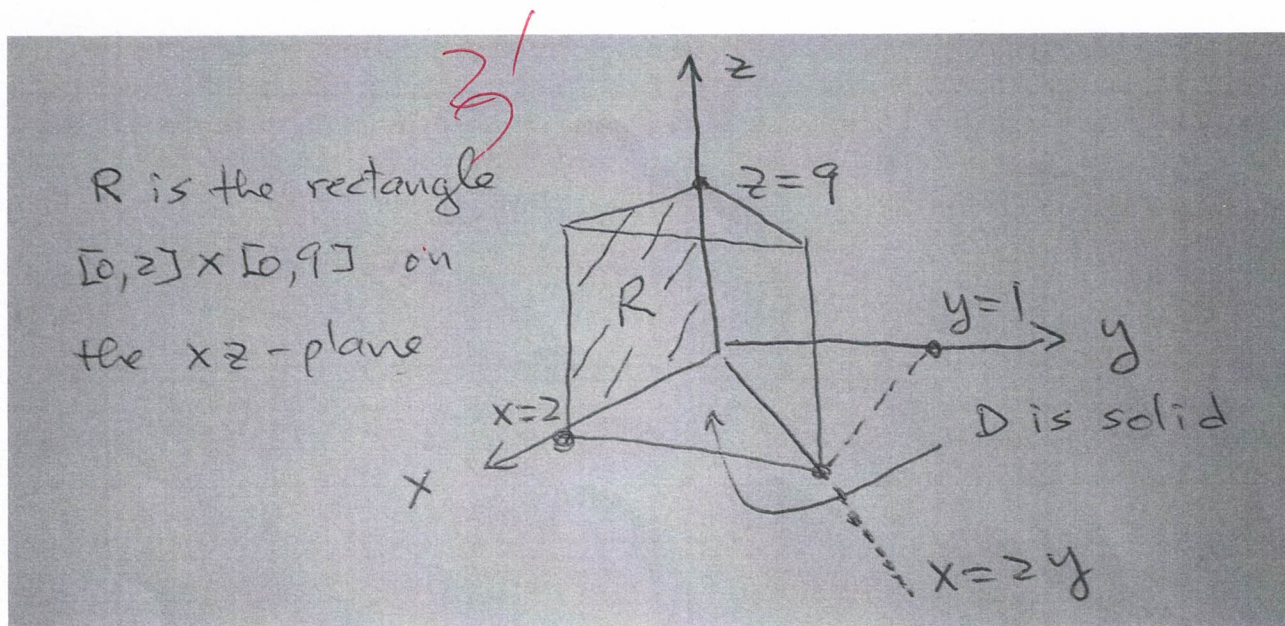

$$(x, y, z) = \pm \left(\frac{1}{2} \sqrt{\frac{2}{15}}, \sqrt{\frac{2}{15}}, \frac{5}{2} \sqrt{\frac{2}{15}} \right).$$

The maximum point is $(\frac{1}{2} \sqrt{\frac{2}{15}}, \sqrt{\frac{2}{15}}, \frac{5}{2} \sqrt{\frac{2}{15}})$ with maximum function value equal to

$$\frac{1}{2} \sqrt{\frac{2}{15}} + 2 \sqrt{\frac{2}{15}} + \frac{25}{2} \sqrt{\frac{2}{15}} = 15 \sqrt{\frac{2}{15}} = \sqrt{30}.$$

8. (8 pts)

(a)

(b)

$$\begin{aligned}
 & \int_0^9 \int_0^1 \int_{2y}^2 \frac{4 \sin x^2}{\sqrt{z}} dx dy dz \\
 &= \iiint_D \frac{4 \sin x^2}{\sqrt{z}} dV \\
 &= \iint_R \left(\int_0^{x/2} \frac{4 \sin x^2}{\sqrt{z}} dy \right) dA \\
 &= \int_0^2 \int_0^9 \frac{2x \sin x^2}{\sqrt{z}} dz dx \quad (\text{or in the order of } dx dz) \\
 &= \int_0^2 2x \sin x^2 [2\sqrt{z}]_0^9 dx \\
 &= 6 \int_0^2 2x \sin x^2 dx \\
 &= 6 [\sin x^2]_0^2 = 6 (\sin 4 - 0) = 6 \sin 4
 \end{aligned}$$

2'

2'

4'

9. (6 pts) The cut-out cylinder portion has volume equal to

$$2 \int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_0^{\sqrt{4-x^2-y^2}} dz dy dx,$$

2'

which, in terms of cylindrical coordinates, is

$$2 \int_0^{2\pi} \int_0^1 \int_0^{\sqrt{4-r^2}} r dz dr d\theta = 4\pi \int_0^1 r \sqrt{4-r^2} dr = -2\pi \int_4^3 \sqrt{w} dw = \frac{4\pi}{3} (8 - 3^{3/2}).$$

2'

(ANOTHER WAY: The cut-out cylinder portion has volume equal to, with R being the unit disk on the xy -plane,

$$2 \iint_R \left(\int_0^{\sqrt{4-x^2-y^2}} dz \right) dA = 2 \iint_R \sqrt{4-x^2-y^2} dA$$

and then use polar coordinates for the evaluation.)

So, the remaining volume is

$$\frac{4\pi}{3} 2^3 - \frac{4\pi}{3} (8 - 3^{3/2}) = 4\pi\sqrt{3}.$$

10. (6 pts) For

$$\mathbf{F} = \langle \tan^{-1}(e^x) + 4y, \ln(1+y^2) + x \rangle,$$

$$\text{curl } \mathbf{F} \cdot \mathbf{k} = \frac{\partial(\ln(1+y^2) + x)}{\partial x} - \frac{\partial(\tan^{-1}(e^x) + 4y)}{\partial y} = 1 - 4 = -3.$$

So using Green's Theorem, we have

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \text{curl } \mathbf{F} \cdot \mathbf{k} dA = -3\pi.$$

Here R is the unit disk bounded by C .

11. (6 pts) Let the boundary curve of S oriented counter-clockwisely be C given by

$$x = \cos t, \quad y = \sin t, \quad z = 0, \quad 0 \leq t < 2\pi.$$

By Stokes' Theorem,

$$\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} d\sigma = \int_C \mathbf{F} \cdot d\mathbf{r}.$$

On C , $\mathbf{F} \cdot \mathbf{r}'(t) = -\sin^2 t + \cos^2 t$. So

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} -\sin^2 t + \cos^2 t dt = \int_0^{2\pi} \cos(2t) dt = \left[\frac{1}{2} \sin(2t) \right]_0^{2\pi} = 0.$$

(ANOTHER WAY: Let R be the unit disk on the xy -plane oriented by the normal vector \mathbf{k} . By Stokes' Theorem,

$$\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} d\sigma = \iint_R \text{curl } \mathbf{F} \cdot \mathbf{k} d\sigma = \iint_R 0 d\sigma = 0.)$$

12. (6 pts) For $\mathbf{F} = \langle x^2, -2xy, xz \rangle$, $\text{div } \mathbf{F} = 2x - 2x + x = x$. By Divergence Theorem,

$$\iint_S \mathbf{F} \cdot \mathbf{n} d\sigma = \iiint_\Omega \text{div } \mathbf{F} dV.$$

In spherical coordinates, $x = \rho \sin \phi \cos \theta$. So the volume integral is equal to

(2)

$$\int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 (\rho \sin \phi \cos \theta) \rho^2 \sin \phi \, d\rho d\theta d\phi = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 \rho^3 \sin^2 \phi \cos \theta \, d\rho d\theta d\phi.$$

which becomes

$$\int_0^{\pi/2} \int_0^{\pi/2} \frac{1}{4} \sin^2 \phi \cos \theta \, d\theta d\phi = \frac{1}{4} \int_0^{\pi/2} \sin^2 \phi \, d\phi = \frac{1}{4} \int_0^{\pi/2} \frac{1 - \cos 2\phi}{2} \, d\phi$$

and equal to

$$\frac{1}{4} \left[\frac{\phi}{2} - \frac{\sin 2\phi}{4} \right]_0^{\pi/2} = \frac{\pi}{16}.$$
