

Review of the last lecture

Key concepts and/or techniques:

- ▶ Bivariate RV: (X, Y) or X and Y with range $\overline{S} \subseteq \overline{S}_X \times \overline{S}_Y \subseteq \mathbb{R}^2$
- ▶ Joint pmf $f(x, y) : \overline{S} \rightarrow (0, 1]$
- ▶ How to derive Marginal pmf from the joint pmf

$$f_X(x) = P_X(X = x) \triangleq P(\{X = x, Y \in \overline{S}_Y(x)\}) = \sum_{y \in \overline{S}_Y(x)} f(x, y)$$

- ▶ Trinomial distribution: $(X, Y) \sim \text{Trinomial}(n, p_X, p_Y)$

$$f(x, y) = \frac{n!}{x!y!(n-x-y)!} p_X^x p_Y^y (1 - p_X - p_Y)^{n-x-y}, (x, y) \in \overline{S},$$
$$\overline{S} = \{(x, y) | x + y \leq n, x = 0, 1, \dots, n, y = 0, 1, \dots, n\}$$

- ▶ X and Y are independent if $f(x, y) = f_X(x)f_Y(y)$

Review of the last lecture

Definition[Joint pmf]

The function $f(x, y) : \bar{S} \rightarrow (0, 1]$ is called the joint probability mass function (joint pmf) of X and Y or (X, Y) , if

1. $f(x, y) > 0$ for $(x, y) \in \bar{S}$,
2. $\sum_{(x,y) \in \bar{S}} f(x, y) = 1$,
3. For $A \subseteq \bar{S}$,

$$P[(X, Y) \in A] \triangleq P(\{(X, Y) \in A\}) = \sum_{(x,y) \in A} f(x, y)$$

which defines the probability function for a set A . In particular, taking $A = \{(x, y)\}$ yields the probability of $X = x$ and $Y = y$, i.e.,

$$P(X = x, Y = y) = f(x, y)$$

Review of the last lecture

Definition[Marginal pmf]

Let (X, Y) be a bivariate RV, or X and Y be two RVs, and have the joint pmf $f(x, y) : \bar{S} \rightarrow (0, 1]$. Sometimes, we are interested in the pmf of X or Y alone, which is called the marginal pmf of X or Y and described by

For $x \in \bar{S}_X$,

$$\begin{aligned} f_X(x) &= P_X(X = x) \stackrel{\Delta}{=} P(\{X = x, Y \in \bar{S}_Y(x)\}) \\ &= \sum_{y \in \bar{S}_Y(x)} f(x, y) \end{aligned}$$

where

$$\bar{S}_Y(x) = \{y | (x, y) \in \bar{S}\} \text{ for the given } x \in \bar{S}_X.$$

Review of the last lecture

It is crucial to understand the following definitions

$$\overline{S}, \overline{S_X}, \overline{S_Y}, \overline{S_X}(y), \overline{S_Y}(x)$$

$$\overline{S} = \{\text{all possible values of } (X, Y)\}$$

$$\overline{S_X} = \{\text{all possible values of } X\} = \{x | (x, y) \in \overline{S}\}$$

$$\overline{S_Y} = \{\text{all possible values of } Y\} = \{y | (x, y) \in \overline{S}\}$$

$$\overline{S_X}(y) = \{x | (x, y) \in \overline{S}\} \text{ for a given } y \in \overline{S_Y}$$

$$\overline{S_Y}(x) = \{y | (x, y) \in \overline{S}\} \text{ for a given } x \in \overline{S_X}$$

Review of the last lecture

Definition

The random variables X and Y are said to be independent if for every $x \in \overline{S_X}$ and $y \in \overline{S_Y}$

$$f(x, y) = f_X(x)f_Y(y)$$

or equivalently,

$$P(X = x, Y = y) = P_X(X = x)P_Y(Y = y).$$

X and Y are said to be dependent if otherwise.

When X and Y are independent,

$$\overline{S} = \overline{S_X} \times \overline{S_Y}, \quad \overline{S} \text{ is said to be rectangular}$$

which is a necessary condition for independence of X and Y .

Mathematical Expectation

Let X and Y be discrete RVs with their joint pmf

$$f(x, y) : \bar{S} \rightarrow (0, 1]$$

Consider a function $g(X, Y)$ of X and Y .

Then the expectation of $g(X, Y)$ is

$$E[g(X, Y)] = \sum_{(x, y) \in \bar{S}} g(x, y) f(x, y)$$

Mathematical Expectation

When $g(X, Y) = X$, $E[X]$ is the mean of X

When $g(X, Y) = (X - E[X])^2$,

$E[(X - E[X])^2]$ is the variance of X

Mathematical Expectation

When $g(X, Y) = X$, $E[X]$ is the mean of X

When $g(X, Y) = (X - E[X])^2$,
 $E[(X - E[X])^2]$ is the variance of X

There are seemingly two ways to calculate $E[X]$:

$$\left\{ \begin{array}{l} E[X] = \overbrace{\sum_{x \in \overline{S}_X} x f_X(x)}^{\text{Marginal pmf}} \\ E[X] = \underbrace{\sum_{(x,y) \in \overline{S}} x f(x,y)}_{\text{Joint pmf}} \end{array} \right.$$

Mathematical Expectation

When $g(X, Y) = X$, $E[X]$ is the mean of X

When $g(X, Y) = (X - E[X])^2$,

$E[(X - E[X])^2]$ is the variance of X

There seems two ways to calculate $E[X]$:

$$\text{Equivalent} \left\{ \begin{array}{l} E(X) = \overbrace{\sum_{x \in \bar{S}_X} x f_x(x)}^{\text{Marginal pmf}} \\ E(X) = \underbrace{\sum_{(x,y) \in \bar{S}} x f(x,y)}_{\text{Joint pmf}} = \sum_{x \in \bar{S}_X} x \underbrace{\sum_{y \in \bar{S}_Y(x)} f(x,y)}_{=f_x(x)} \end{array} \right.$$

Example 1, [Page 134] — Revisited

Question

Recall that X and Y are discrete RVs with joint pmf

$f(x, y) : \bar{S} \rightarrow (0, 1]$ with $\bar{S}_X = \bar{S}_Y = \{1, 2, 3, 4\}$

$$f(x, y) = \begin{cases} \frac{2}{16} & 1 \leq x < y \leq 4 \\ \frac{1}{16} & 1 \leq x = y \leq 4 \end{cases}$$

What is $E[X + Y]$?

Example 1, [Page 134] — Revisited

$$\begin{aligned} E(X + Y) &= \sum_{(x,y) \in \bar{S}} (x + y) f(x, y) \\ &= \sum_{1 \leq x=y \leq 4} (x + y) \frac{1}{16} + \sum_{1 \leq x < y \leq 4} (x + y) \frac{2}{16} \\ &= \sum_{x=1}^4 (2x) \frac{1}{16} + \sum_{x=1}^4 \sum_{y \in \bar{S}_Y(x), x < y} (x + y) \frac{2}{16} \end{aligned}$$

Note: the expectation is w.r.t all random variable, i.e. X and Y .

Section 4.2 The correlation coefficient

Motivation

Study the relation between two RVs (random phenomena)

Covariance of X and Y

Definition

Let X and Y be RVs with joint pmf $f(x, y) : \bar{S} \rightarrow (0, 1]$
Take

$$\begin{aligned} g(X, Y) &= (X - E(X))(Y - E(Y)) \\ \text{Cov}(X, Y) &\triangleq E[(X - E(X))(Y - E(Y))] \\ &= \sum_{(x, y) \in \bar{S}} (x - E(X))(y - E(Y))f(x, y) \end{aligned}$$

Moreover, we have

$$\text{Cov}(X, Y) \triangleq E(XY) - E(X)E(Y)$$

Covariance of X and Y

- ▶ $Cov(X, Y) = E(XY) - E(X)E(Y)$

When $Cov(X, Y) = 0$, X and Y are uncorrelated.

When $Cov(X, Y) > 0$, X and Y are positively correlated.

When $Cov(X, Y) < 0$, X and Y are negatively correlated.

- ▶ Interpretation: Roughly speaking, a positive or negative covariance indicate that the values of $X - E(X)$ and $Y - E(Y)$ obtained in a single experiment “tend” to have the same or the opposite sign respectively.

$$Cov(X, Y) = \sum_{(x,y) \in \bar{S}} (x - E(X))(y - E(Y))f(x, y)$$

Example 1 [Positively Correlated and Negatively Correlated RVs]

Assume that X and Y are uniformly distributed over the ellipses.

Question: which figure shows that X and Y are positively correlated?

Example 1 [Positively Correlated and Negatively Correlated RVs]

Assume that X and Y are uniformly distributed over the ellipses.

Independence \Rightarrow Uncorrelation

- If X and Y are independent, we have

$$f(x, y) = f_X(x)f_Y(y) \Rightarrow \overline{S} = \overline{S_X} \times \overline{S_Y}$$

$$\begin{aligned} E(XY) &= \sum_{(x,y) \in \overline{S}} xyf(x, y) = \sum_{x \in \overline{S_X}} \sum_{y \in \overline{S_Y}} xyf_X(x)f_Y(y) \\ &= \sum_{x \in \overline{S_X}} xf_X(x) \left[\sum_{y \in \overline{S_Y}} yf_Y(y) \right] = E(X)E(Y) \end{aligned}$$

Independence \Rightarrow Uncorrelation

Therefore

$$\text{Cov}(X, Y) = E(XY) - E(X)E(Y) = 0$$

Independence of two RVs \Rightarrow uncorrelation of two RVs.

However, the converse is not true , i.e, there exist X and Y which are uncorrelated but not independent.

Example 2 [Uncorrelation \nRightarrow Independence]

Question

Let (X, Y) be a bivariate RV that takes values $(1, 0), (0, 1), (-1, 0), (0, -1)$, each with probability $\frac{1}{4}$, as shown in the figure below

Question 1

What are the marginal pmf of X and Y ?

Question 2

What is $Cov(X, Y)$?

Question 3

Are X and Y independent?

Example 2 [Uncorrelation \nRightarrow Independence]

To find marginal pmf of X and Y , $\overline{S_X} = \overline{S_Y} = \{-1, 0, 1\}$

$$f_X(x) = \begin{cases} \frac{1}{4}, & x = 1 \\ \frac{1}{2}, & x = 0 \\ \frac{1}{4}, & x = -1 \end{cases} \quad f_Y(y) = \begin{cases} \frac{1}{4}, & y = 1 \\ \frac{1}{2}, & y = 0 \\ \frac{1}{4}, & y = -1 \end{cases}$$

$$\text{Cov}(X, Y) = E(XY) - E(X)E(Y) = 0 - 0 \times 0 = 0$$

which shows that X and Y are uncorrelated.

$$f_X(0)f_Y(1) = \frac{1}{2} \times \frac{1}{4} = \frac{1}{8} \neq f(0, 1) = \frac{1}{4}$$

which shows that X and Y are NOT independent.

Correlation Coefficient

Definition

The correlation coefficient of X and Y that have nonzero variance is defined as

$$\rho(X, Y) = \frac{\text{Cov}(X, Y)}{\sqrt{\text{Var}(X)}\sqrt{\text{Var}(Y)}}$$

- Interpretation : $\rho > 0$ (or $\rho < 0$) indicate the values of $X - E[X]$ and $Y - E[Y]$ “tend” to have the same (or negative, respectively) sign.

Properties of the Correlation Coefficient

- ▶ It is a normalized version of $\text{Cov}(X, Y)$ and in fact $-1 \leq \rho(X, Y) \leq 1$.
- ▶ $\rho = 1$ (resp. $\rho = -1$) if and only if there exists a positive (resp. negative) constant c such that

$$Y - E(Y) = c(X - E(X)),$$

and the size of $|\rho|$ provides a normalized measure of the extent to which this is true.

Proof for Properties of Correlation Coefficient (1/3)

To prove $|\rho(X, Y)| \leq 1$ is equivalent to prove that

$$\text{Cov}(X, Y)^2 \leq \text{Var}(X)\text{Var}(Y)$$

Proof for Properties of Correlation Coefficient (1/3)

To prove $|\rho(X, Y)| \leq 1$ is equivalent to prove that

$$\text{Cov}(X, Y)^2 \leq \text{Var}(X)\text{Var}(Y)$$

To this goal, we consider

$$E((V + tW)^2) \geq 0,$$

where $t \in \mathbb{R}$, $V = X - E(X)$, $W = Y - E(Y)$. Then we have

$$\begin{aligned} E((V + tW)^2) &= E(V^2 + 2tVW + W^2) \\ &= E(V^2) + 2tE(VW) + t^2E(W^2) \geq 0 \end{aligned}$$

Proof for Properties of Correlation Coefficient (2/3)

Noting that

$$E(V^2) = \text{Var}(X), E(W^2) = \text{Var}(Y), E(VW) = \text{Cov}(X, Y)$$

yields that for $t \in \mathbb{R}$,

$$E((V + tW)^2) = \text{Var}(X) + 2\text{Cov}(X, Y)t + \text{Var}(Y)t^2 \geq 0$$

One Solution

No Real Solution

Since the above equation is true for any $t \in \mathbb{R}$, it must hold that

$$4\text{Cov}(X, Y)^2 - 4\text{Var}(X)\text{Var}(Y) \leq 0, \text{ i.e., } \text{Cov}(X, Y)^2 \leq \text{Var}(X)\text{Var}(Y)$$

which implies that $|\rho(X, Y)| \leq 1$.

Proof for Properties of Correlation Coefficient (3/3)

When $\text{Cov}(X, Y)^2 - \text{Var}(X)\text{Var}(Y) = 0$, $|\rho(X, Y)| = 1$ implying

$$\begin{aligned} E((V + tW)^2) &= \text{Var}(X) + 2\text{Cov}(X, Y)t + \text{Var}(Y)t^2 = 0 \\ &= \text{Var}(X) \pm 2\sqrt{\text{Var}(X)}\sqrt{\text{Var}(Y)}t + \text{Var}(Y)t^2 = 0 \\ &= (\sqrt{\text{Var}(X)} \pm \sqrt{\text{Var}(Y)}t)^2 = 0 \end{aligned}$$

$$t^* = \mp \frac{\sqrt{\text{Var}(X)}}{\sqrt{\text{Var}(Y)}}.$$

Inserting the above t^* back in $E((V + tW)^2)$ yields

$$E((V + t^*W)^2) = 0 \implies V = -t^*W$$

$$X - E(X) = \pm \frac{\sqrt{\text{Var}(X)}}{\sqrt{\text{Var}(Y)}}(Y - E(Y)),$$

where $\rho = 1$ (resp. $\rho = -1$) corresponds to $+$ (resp. $-$).

Example

Question

Consider n independent tosses of a coin with probability of a head equal to p . Let X and Y be the number of heads and of tails in the n tosses, respectively. Calculate the correlation coefficient of X and Y .

Example

Question

Consider n independent tosses of a coin with probability of a head equal to p . Let X and Y be the number of heads and of tails in the n tosses, respectively. Calculate the correlation coefficient of X and Y .

$$X + Y = n \Rightarrow E[X] + E[Y] = n \Rightarrow X - E(X) = -[Y - E(Y)]$$

Example

Question

Consider n independent tosses of a coin with probability of a head equal to p . Let X and Y be the number of heads and of tails in the n tosses, respectively. Calculate the correlation coefficient of X and Y .

$$X + Y = n \Rightarrow E[X] + E[Y] = n \Rightarrow X - E(X) = -[Y - E(Y)]$$

$$\begin{aligned} \text{Cov}(X, Y) &= E[(X - E(X))(Y - E(Y))] \\ &= -E[(Y - E(Y))^2] = -\text{Var}(Y) \end{aligned}$$

$$\text{Var}(X) = E[(X - E(X))^2] = E[(Y - E(Y))^2] = \text{Var}(Y)$$

$$\rho(X, Y) = \frac{-\text{Var}(Y)}{\sqrt{\text{Var}(X)}\sqrt{\text{Var}(Y)}} = \frac{-\text{Var}(Y)}{\sqrt{\text{Var}(Y)}\sqrt{\text{Var}(Y)}} = -1$$
