

Barick Chung

Employment:
2014-present Senior Lecturer, Department of Economics, CUSZ – Shenzhen.
2012-2014 Lecturer, School of Economics and Finance, University of Hong Kong.
2006-2012 Instructor, Department of Economics, CUHK – Hong Kong.

Education:
2003-2007 Ph.D. (Business) Indiana University – Bloomington.
1987-1991 BS.Sc. (Economics) Chinese University of Hong Kong – Hong Kong.

Research paper:
Chung, Barick, "Two Level Price Discrimination and Vertical Relationship" (March 05, 2012). Available at SSRN: <http://ssrn.com/abstract=1997070>.

$$E_p \text{ (at point A)} \cong -1.333$$

Need calculus ??

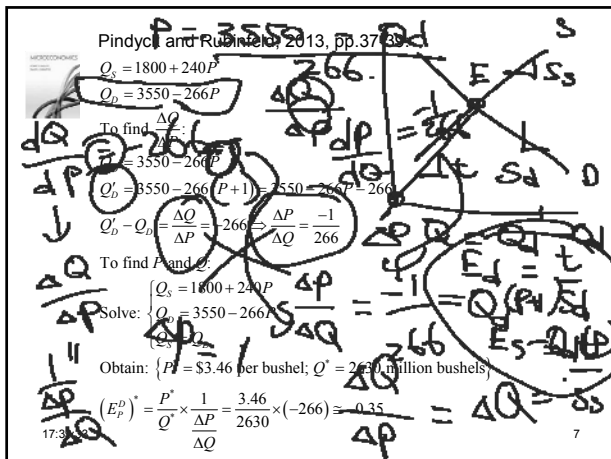

17:39:33

3

 Demand is said to be **inelastic** when the elasticity is less than +1

Demand is said to be **unit elastic** when the elasticity is +1

Demand is said to be **elastic** when the elasticity is greater than +1

17:39:33

8

 Pindyck and Rubinfeld, 2013, p. 35:

Income elasticity is the percentage change in the quantity demanded resulting from a 1-percent increase in income.

$$E_I = \frac{\% \Delta Q}{\% \Delta I} = \frac{\frac{\Delta Q}{Q}}{\frac{\Delta I}{I}} = \frac{I}{Q} \times \frac{1}{\frac{\Delta I}{\Delta Q}}$$

Suppose the demand function for good X is:

$$Q_x^d = F(P_x, P_y, P_z, \text{Income, Taste, ...})$$

$Q_A^d = f(\underbrace{P_A}_{\text{Price of good x}}, \underbrace{P_B, I}_{\text{Income}}, T, \dots)$

Quantity demanded of good x Price of other goods

Demand function

17:39:33

14

Suppose the demand function for good X is:

$$Q_x^d = F(P_x, P_y, P_z, \text{Income, Taste, ...})$$

Income elasticity of demand measures the responsiveness of quantity demanded (Q_x^d) to changes in its income (I)

$$E_I = \frac{\% \text{ change in quantity demanded}}{\% \text{ change in income}} = \frac{\frac{\Delta Q^d}{Q^d}}{\frac{\Delta I}{I}} = \frac{\Delta Q^d}{\Delta I} \times \frac{I}{Q^d}$$

$E_I > 0$ iff $\frac{\Delta Q^d}{\Delta I} > 0$

17:39:33

15

Income Elasticity of Demand

A good is a **Normal Good** if (and only if): **income elasticity** is positive,

A good is an **Inferior Good** if (and only if): **income elasticity** is negative

17:39:33

16

The demand function is:

$$Q_x^d = F (P_x, P_y, P_z, \text{Income, Taste, ... })$$

Cross-price elasticity of demand measures the responsiveness of quantity demanded (Q_x^d) to changes in the **price of other goods** (P_y or P_z).

$$E_{AB} = \frac{\% \text{ change in quantity demanded for good A}}{\% \text{ change in price of good B}}$$

$$E_{AB} = \frac{\frac{\Delta Q_A}{Q_A}}{\frac{\Delta P_B}{P_B}} = \frac{P_B}{Q_A} \cdot \frac{\Delta Q_A}{\Delta P_B}$$

if $E_{AB} > 0$ then goods are substitutes
if $E_{AB} < 0$ then goods are complements

17:39:33

17

Cross-price elasticity of demand

A pair of goods are **Substitutes** if (and only if): the **cross-price elasticity** of demand is positive

A pair of goods are **Complements** if (and only if): the **cross-price elasticity** of demand is negative

17:39:33

18

Example #1:

A company finds that quantity demands is a function of:

$$Q_x^d = f(P_x, P_y, I, A)$$

where I is the income of people, P_y is the price of a related good, and A is the advertising level of the good.

17:39:33

19

Example #1:

$$\ln Q_x^d = 10 - 1.2 \times \ln P_x + 1.7 \times \ln P_y + 3 \times \ln I + 2 \times \ln A$$
