- 130. Let L be the limit of the convergent sequence  $\{a_n\}$ . Then by definition of convergence, for  $\frac{\epsilon}{2}$  there corresponds an N such that for all m and n,  $m > N \Rightarrow |a_m L| < \frac{\epsilon}{2}$  and  $n > N \Rightarrow |a_n L| < \frac{\epsilon}{2}$ . Now  $|a_m a_n| = |a_m L + L a_n| \le |a_m L| + |L a_n| < \frac{\epsilon}{2} + \frac{\epsilon}{2} = \epsilon$  whenever m > N and n > N.
- 131. Given an  $\epsilon > 0$ , by definition of convergence there corresponds an N such that for all n > N,  $|L_1 a_n| < \epsilon$  and  $|L_2 a_n| < \epsilon$ . Now  $|L_2 L_1| = |L_2 a_n + a_n L_1| \le |L_2 a_n| + |a_n L_1| < \epsilon + \epsilon = 2\epsilon$ .  $|L_2 L_1| < 2\epsilon$  says that the difference between two fixed values is smaller than any positive number  $2\epsilon$ . The only nonnegative number smaller than every positive number is 0, so  $|L_1 L_2| = 0$  or  $L_1 = L_2$ .
- 132. Let k(n) and i(n) be two order-preserving functions whose domains are the set of positive integers and whose ranges are a subset of the positive integers. Consider the two subsequences  $a_{k(n)}$  and  $a_{i(n)}$ , where  $a_{k(n)} \to L_1$ ,  $a_{i(n)} \to L_2$  and  $L_1 \neq L_2$ . Thus  $\left| a_{k(n)} a_{i(n)} \right| \to \left| L_1 L_2 \right| > 0$ . So there does not exist N such that for all m,  $n > N \Rightarrow \left| a_m a_n \right| < \epsilon$ . So by Exercise 128, the sequence  $\{a_n\}$  is not convergent and hence diverges.

- 133.  $a_{2k} \to L \Leftrightarrow \text{ given an } \epsilon > 0 \text{ there corresponds an } N_1 \text{ such that } \left[ 2k > N_1 \Rightarrow \left| a_{2k} L \right| < \epsilon \right]. \text{ Similarly,}$   $a_{2k+1} \to L \Leftrightarrow \left[ 2k+1 > N_2 \Rightarrow \left| a_{2k+1} L \right| < \epsilon \right]. \text{ Let } N = \max\{N_1, N_2\}. \text{ Then } n > N \Rightarrow \left| a_n L \right| < \epsilon \text{ whether } n \text{ is even or odd, and hence } a_n \to L.$
- 134. Assume  $a_n \to 0$ . This implies that given an  $\epsilon > 0$  there corresponds an N such that  $n > N \Rightarrow |a_n 0| < \epsilon$   $\Rightarrow |a_n| < \epsilon \Rightarrow |a_n| < \epsilon \Rightarrow |a_n| 0| < \epsilon \Rightarrow |a_n| \to 0$ . On the other hand, assume  $|a_n| \to 0$ . This implies that given an  $\epsilon > 0$  there corresponds an N such that for n > N,  $||a_n| 0| < \epsilon \Rightarrow ||a_n|| < \epsilon \Rightarrow |a_n| < \epsilon \Rightarrow |a_n 0| < \epsilon \Rightarrow |a_n \to 0$ .

135. (a) 
$$f(x) = x^2 - a \Rightarrow f'(x) = 2x \Rightarrow x_{n+1} = x_n - \frac{x_n^2 - a}{2x_n} \Rightarrow x_{n+1} = \frac{2x_n^2 - \left(x_n^2 - a\right)}{2x_n} = \frac{x_n^2 + a}{2x_n} = \frac{\left(x_n + \frac{a}{x_n}\right)}{2}$$

- (b)  $x_1 = 2$ ,  $x_2 = 1.75$ ,  $x_3 = 1.732142857$ ,  $x_4 = 1.73205081$ ,  $x_5 = 1.732050808$ ; we are finding the positive number where  $x^2 3 = 0$ ; that is, where  $x^2 = 3$ , x > 0, or where  $x = \sqrt{3}$ .
- 136.  $x_1 = 1$ ,  $x_2 = 1 + \cos(1) = 1.540302306$ ,  $x_3 = 1.540302306 + \cos(1 + \cos(1)) = 1.570791601$ ,  $x_4 = 1.570791601 + \cos(1.570791601) = 1.570796327 = \frac{\pi}{2}$  to 9 decimal places. After a few steps, the arc  $(x_{n-1})$  and line segment  $\cos(x_{n-1})$  are nearly the same as the quarter circle.
- 137-148. Example CAS Commands:

Mathematica: (sequence functions may vary):

```
Clear[a, n]

a[n_{-}] := n^{1/n}

first25= Table[N[a[n]], {n, 1, 25}]

Limit[a[n], n \rightarrow 8]
```

The last command (Limit) will not always work in Mathematica. You could also explore the limit by enlarging your table to more than the first 25 values.

If you know the limit (1 in the above example), to determine how far to go to have all further terms within 0.01 of the limit, do the following.

```
\label{lim-n} $$\lim = 1$$ $Do[\{diff=Abs[a[n]-lim], If[diff<.01, \{minN=n, Abort[]\}]\}, \{n, 2, 1000\}]$$ $$minN$$
```

For sequences that are given recursively, the following code is suggested. The portion of the command  $a[n_{-}]:=a[n]$  stores the elements of the sequence and helps to streamline computation.

```
Clear[a, n]

a[1]=1;

a[n_{-}]:=a[n]=a[n-1]+(1/5)^{n-1}

first25= Table[N[a[n]],{n, 1, 25}]
```

The limit command does not work in this case, but the limit can be observed as 1.25.

Clear[minN, lim]

lim = 1.25

 $Do[\{diff = Abs[a[n] - lim], If[diff < .01, \{minN = n, Abort[]\}]\}, \{n, 2, 1000\}]$ 

minN

86. Yes: 
$$\sum \left(\frac{1}{a_n}\right)$$
 diverges. The reasoning:  $\sum a_n$  converges  $\Rightarrow a_n \to 0 \Rightarrow \frac{1}{a_n} \to \infty \Rightarrow \sum \left(\frac{1}{a_n}\right)$  diverges by the *n*th-Term Test.

- 87. Since the sum of a finite number of terms is finite, adding or subtracting a finite number of terms from a series that diverges does not change the divergence of the series.
- 88. Let  $A_n = a_1 + a_2 + ... + a_n$  and  $\lim_{n \to \infty} A_n = A$ . Assume  $\sum (a_n + b_n)$  converges to S. Let  $S_n = (a_1 + b_1) + (a_2 + b_2) + ... + (a_n + b_n) \Rightarrow S_n = (a_1 + a_2 + ... + a_n) + (b_1 + b_2 + ... + b_n)$   $\Rightarrow b_1 + b_2 + ... + b_n = S_n A_n \Rightarrow \lim_{n \to \infty} (b_1 + b_2 + ... + b_n) = S A \Rightarrow \sum b_n$  converges. This contradicts the assumption that  $\sum b_n$  diverges; therefore,  $\sum (a_n + b_n)$  diverges.

(a) After 24 hours, before the second pill:  $300e^{(-0.12)(24)} \approx 16.840$  mg; after 48 hours, the amount present after 24 hours continues to decay and the dose taken at 24 hours has 24 hours to decay, so the amount present is  $300e^{(-0.12)(48)} + 300e^{(-0.12)(24)} \approx 0.945 + 16.840 = 17.785$  mg.
  - (b) The long-run quantity of the drug is  $300\sum_{1}^{\infty} \left(e^{(-0.12)(24)}\right)^n = 300\frac{e^{(-0.12)(24)}}{1 e^{(-0.12)(24)}} \approx 17.84 \text{ mg.}$

- 95. (a) The endpoint of any closed interval remaining at any stage of the construction will remain in the Cantor set, so some points in the set include  $0, \frac{1}{27}, \frac{2}{27}, \frac{1}{9}, \frac{2}{9}, \frac{7}{27}, \frac{8}{27}, \frac{1}{3}, \frac{2}{3}, \frac{7}{9}, \frac{8}{9}, 1$ .
  - (b) The lengths of the intervals removed are:

Stage 1: 
$$\frac{1}{3}$$

Stage 2: 
$$\frac{1}{3} \left( 1 - \frac{1}{3} \right) = \frac{2}{9}$$

Stage 3: 
$$\frac{1}{3}\left(1-\frac{1}{3}-\frac{2}{9}\right) = \frac{4}{27}$$
 and so on.

Thus the sum of the lengths of the intervals removed is  $\sum_{n=1}^{\infty} \frac{1}{3} \left(\frac{2}{3}\right)^{n-1} = \frac{1}{3} \cdot \frac{1}{1 - (2/3)} = 1.$

 $\infty$  if  $a < \frac{1}{2}$ . If  $a > \frac{1}{2}$ , the terms of the series eventually become negative and the Integral Test does not apply. From that point on, however, the series behaves like a negative multiple of the harmonic series, and so it diverges.

43. (a)

(b) There are  $(13)(365)(24)(60)(60) \left(10^9\right)$  seconds in 13 billion years; by part (a)  $s_n \le 1 + \ln n$  where  $n = (13)(365)(24)(60)(60) \left(10^9\right) \Rightarrow s_n \le 1 + \ln \left((13)(365)(24)(60)(60) \left(10^9\right)\right)$ =  $1 + \ln(13) + \ln(365) + \ln(24) + 2\ln(60) + 9\ln(10) \approx 41.55$ 

44. No, because  $\sum_{n=1}^{\infty} \frac{1}{nx} = \frac{1}{x} \sum_{n=1}^{\infty} \frac{1}{n}$  and  $\sum_{n=1}^{\infty} \frac{1}{n}$  diverges

45. Yes. If  $\sum_{n=1}^{\infty} a_n$  is a divergent series of positive numbers, then  $\left(\frac{1}{2}\right)\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \left(\frac{a_n}{2}\right)$  also diverges and  $\frac{a_n}{2} < a_n$ .

There is no "smallest" divergent series of positive number: for any divergent series  $\sum_{n=1}^{\infty} a_n$  of positive

numbers  $\sum_{n=1}^{\infty} \left( \frac{a_n}{2} \right)$  has smaller terms and still diverges.

- 46. No, if  $\sum_{n=1}^{\infty} a_n$  is a convergent series of positive numbers, then  $2\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} 2a_n$  also converges, and  $2a_n \ge a_n$ . There is no "largest" convergent series of positive numbers.
- 47. (a) Both integrals can represent the area under the curve  $f(x) = \frac{1}{\sqrt{x+1}}$ , and the sum  $s_{50}$  can be considered an approximation of either integral using rectangles with  $\Delta x = 1$ . The sum  $s_{50} = \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}}$  is an overestimate of the integral  $\int_{1}^{51} \frac{1}{\sqrt{x+1}} dx$ . The sum  $s_{50}$  represents a left-hand sum (that is, the we are choosing the left-hand endpoint of each subinterval for  $c_i$ ) and because f is a decreasing function, the value of f is a maximum at the left-hand endpoint of each subinterval. The area of each rectangle overestimates the true area, thus  $\int_{1}^{51} \frac{1}{\sqrt{x+1}} dx < \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}}$ . In a similar manner,  $s_{50}$  underestimates the integral  $\int_{0}^{50} \frac{1}{\sqrt{x+1}} dx$ . In this case, the sum  $s_{50}$  represents a right-hand sum and because f is a decreasing function, the value of f is a minimum at the right-hand endpoint of each subinterval. The area of each rectangle underestimates the true area, thus  $\sum_{n=1}^{50} \frac{1}{\sqrt{n+1}} < \int_{0}^{50} \frac{1}{\sqrt{x+1}} dx$ . Evaluating the integrals we find  $\int_{1}^{51} \frac{1}{\sqrt{x+1}} dx = \left[2\sqrt{x+1}\right]_{1}^{51} = 2\sqrt{52} 2\sqrt{2} \approx 11.6$  and  $\int_{0}^{50} \frac{1}{\sqrt{x+1}} dx = \left[2\sqrt{x+1}\right]_{0}^{50} = 2\sqrt{51} 2\sqrt{1} \approx 12.3$ . Thus,  $11.6 < \sum_{n=1}^{50} \frac{1}{\sqrt{n+1}} < 12.3$ . (b)  $s_n > 1000 \Rightarrow \int_{1}^{n+1} \frac{1}{\sqrt{x+1}} dx = \left[2\sqrt{x+1}\right]_{1}^{n+1} = 2\sqrt{n+1} 2\sqrt{2} > 1000 \Rightarrow n > \left(500 + \sqrt{2}\right)^2 1 \approx 251414.2$
- 48. (a) Since we are using  $s_{30} = \sum_{n=1}^{30} \frac{1}{n^4}$  to estimate  $\sum_{n=1}^{\infty} \frac{1}{n^4}$ , the error is given by  $\sum_{n=31}^{\infty} \frac{1}{n^4}$ . We can consider this sum as an estimate of the area under the curve  $f(x) = \frac{1}{x^4}$  when  $x \ge 30$  using rectangles with  $\Delta x = 1$  and  $c_i$  is the right-hand endpoint of each subinterval. Since f is a decreasing function, the value of f is a minimum at the right-hand endpoint of each subinterval, thus  $\sum_{n=31}^{\infty} \frac{1}{n^4} < \int_{30}^{\infty} \frac{1}{x^4} dx = \lim_{b \to \infty} \int_{30}^{b} \frac{1}{x^4} dx$   $= \lim_{b \to \infty} \left[ -\frac{1}{3x^3} \right]_{30}^{b} = \lim_{b \to \infty} \left( -\frac{1}{3b^3} + \frac{1}{3(30)^3} \right) \approx 1.23 \times 10^{-5}.$  Thus the error  $< 1.23 \times 10^{-5}$ .
  - (b) We want  $S s_n < 0.000001 \Rightarrow \int_n^\infty \frac{1}{x^4} dx < 0.000001 \Rightarrow \int_n^\infty \frac{1}{x^4} dx = \lim_{b \to \infty} \int_n^b \frac{1}{x^4} dx = \lim_{b \to \infty} \left[ -\frac{1}{3x^3} \right]_n^b$ =  $\lim_{b \to \infty} \left( -\frac{1}{3b^3} + \frac{1}{3n^3} \right) = \frac{1}{3n^3} < 0.000001 \Rightarrow n > \sqrt[3]{\frac{1000000}{3}} \approx 69.336 \Rightarrow n \ge 70.$
- 49. We want  $S s_n < 0.01 \Rightarrow \int_n^{\infty} \frac{1}{x^3} dx < 0.01 \Rightarrow \int_n^{\infty} \frac{1}{x^3} dx = \lim_{b \to \infty} \int_n^b \frac{1}{x^3} dx = \lim_{b \to \infty} \left[ -\frac{1}{2x^2} \right]_n^b = \lim_{b \to \infty} \left( -\frac{1}{2b^2} + \frac{1}{2n^2} \right)$   $= \frac{1}{2n^2} < 0.01 \Rightarrow n > \sqrt{50} \approx 7.071 \Rightarrow n \ge 8 \Rightarrow S \approx s_8 = \sum_{n=1}^{8} \frac{1}{n^3} \approx 1.195$

50. We want 
$$S - s_n < 0.1 \Rightarrow \int_n^\infty \frac{1}{x^2 + 4} dx < 0.1 \Rightarrow \lim_{b \to \infty} \int_n^b \frac{1}{x^2 + 4} dx = \lim_{b \to \infty} \left[ \frac{1}{2} \tan^{-1} \left( \frac{x}{2} \right) \right]_n^b$$

$$= \lim_{b \to \infty} \left( \frac{1}{2} \tan^{-1} \left( \frac{b}{2} \right) - \frac{1}{2} \tan^{-1} \left( \frac{n}{2} \right) \right) = \frac{\pi}{4} - \frac{1}{2} \tan^{-1} \left( \frac{n}{2} \right) < 0.1 \Rightarrow n > 2 \tan \left( \frac{\pi}{2} - 0.2 \right) \approx 9.867 \Rightarrow n \ge 10$$

$$\Rightarrow S \approx s_{10} = \sum_{n=1}^{10} \frac{1}{n^2 + 4} \approx 0.57$$

- 51.  $S s_n < 0.00001 \Rightarrow \int_n^\infty \frac{1}{x^{1.1}} dx < 0.00001 \Rightarrow \int_n^\infty \frac{1}{x^{1.1}} dx = \lim_{b \to \infty} \int_n^b \frac{1}{x^{1.1}} dx = \lim_{b \to \infty} \left[ -\frac{10}{x^{0.1}} \right]_n^b = \lim_{b \to \infty} \left( -\frac{10}{b^{0.1}} + \frac{10}{n^{0.1}} \right)$   $= \frac{10}{n^{0.1}} < 0.00001 \Rightarrow n > 1000000^{10} \Rightarrow n > 10^{60}$
- 52.  $S s_n < 0.01 \Rightarrow \int_n^\infty \frac{1}{x(\ln x)^3} dx < 0.01 \Rightarrow \int_n^\infty \frac{1}{x(\ln x)^3} dx = \lim_{b \to \infty} \int_n^b \frac{1}{x(\ln x)^3} dx = \lim_{b \to \infty} \left[ -\frac{1}{2(\ln x)^2} \right]_n^b$   $= \lim_{b \to \infty} \left( -\frac{1}{2(\ln b)^2} + \frac{1}{2(\ln n)^2} \right) = \frac{1}{2(\ln n)^2} < 0.01 \Rightarrow n > e^{\sqrt{50}} \approx 1177.405 \Rightarrow n \ge 1178$
- 53. Let  $A_n = \sum_{k=1}^n a_k$  and  $B_n = \sum_{k=1}^n 2^k a_{2^k}$ , where  $\{a_k\}$  is a nonincreasing sequence of positive terms converging to 0. Note that  $\{A_n\}$  and  $\{B_n\}$  are nondecreasing sequences of positive terms. Now,

$$B_n = 2a_2 + 4a_4 + 8a_8 + \dots + 2^n a_{2^n}$$

$$= 2a_2 + (2a_4 + 2a_4) + (2a_8 + 2a_8 + 2a_8 + 2a_8) + \dots + \underbrace{\left(2a_{2^n} + 2a_{2^n} + \dots + 2a_{2^n}\right)}_{2^{n-1} \text{ towns}}$$

$$\leq 2a_1 + 2a_2 + \left(2a_3 + 2a_4\right) + \left(2a_5 + 2a_6 + 2a_7 + 2a_8\right) + \ldots + \left(2a_{\left(2^{n-1}\right)} + 2a_{\left(2^{n-1}+1\right)} + \ldots + 2a_{\left(2^n\right)}\right) = 2A_{\left(2^n\right)}$$

 $\leq 2\sum_{k=1}^{\infty}a_k$ . Therefore if  $\sum a_k$  converges, then  $\{B_n\}$  is bounded above  $\Rightarrow \sum 2^k a_{\left(2^k\right)}$  converges. Conversely,

$$A_n = a_1 + (a_2 + a_3) + (a_4 + a_5 + a_6 + a_7) + \dots + a_n < a_1 + 2a_2 + 4a_4 + \dots + 2^n a_{2^n} = a_1 + B_n < a_1 + \sum_{k=1}^{\infty} 2^k a_{2^k}.$$

Therefore, if  $\sum_{k=1}^{\infty} 2^k a_{(2^k)}$  converges, then  $\{A_n\}$  is bounded above and hence converges.

54. (a) 
$$a_{(2^n)} = \frac{1}{2^n \ln(2^n)} = \frac{1}{2^n \cdot n(\ln 2)} \Rightarrow \sum_{n=2}^{\infty} 2^n a_{(2^n)} = \sum_{n=2}^{\infty} 2^n \frac{1}{2^n \cdot n(\ln 2)} = \frac{1}{\ln 2} \sum_{n=2}^{\infty} \frac{1}{n}$$
, which diverges  $\Rightarrow \sum_{n=2}^{\infty} \frac{1}{n \ln n}$  diverges.

(b) 
$$a_{(2^n)} = \frac{1}{2^{np}} \Rightarrow \sum_{n=1}^{\infty} 2^n a_{(2^n)} = \sum_{n=1}^{\infty} 2^n \cdot \frac{1}{2^{np}} = \sum_{n=1}^{\infty} \frac{1}{(2^n)^{p-1}} = \sum_{n=1}^{\infty} \left(\frac{1}{2^{p-1}}\right)^n$$
, a geometries series that converges if  $\frac{1}{2^{p-1}} < 1$  or  $p > 1$ , but diverges if  $p \le 1$ .

55. (a) 
$$\int_{2}^{\infty} \frac{dx}{x(\ln x)^{p}}; \quad \left[ u = \ln x, du = \frac{dx}{x} \right] \to \int_{\ln 2}^{\infty} u^{-p} du = \lim_{b \to \infty} \left[ \frac{u^{-p+1}}{-p+1} \right]_{\ln 2}^{b} = \lim_{b \to \infty} \left( \frac{1}{1-p} \right) \left[ b^{-p+1} - (\ln 2)^{-p+1} \right]$$
$$= \begin{cases} \frac{1}{p-1} (\ln 2)^{-p+1} & p > 1 \\ \infty, & p < 1 \end{cases} \Rightarrow \text{ the improper integral converges if } p > 1 \text{ and diverges if } p < 1. \text{ For } p = 1:$$
$$\int_{2}^{\infty} \frac{dx}{x \ln x} = \lim_{b \to \infty} \left[ \ln(\ln x) \right]_{2}^{b} = \lim_{b \to \infty} \left[ \ln(\ln b) - \ln(\ln 2) \right] = \infty, \text{ so the improper integral diverges if } p = 1.$$

- (b) Since the series and the integral converge or diverge together,  $\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^p}$  converges if and only if p > 1.
- 56. (a)  $p = 1 \Rightarrow$  the series diverges
  - (b)  $p = 1.01 \Rightarrow$  the series converges
  - (c)  $\sum_{n=2}^{\infty} \frac{1}{n(\ln n^3)} = \frac{1}{3} \sum_{n=2}^{\infty} \frac{1}{n(\ln n)}$ ;  $p = 1 \Rightarrow$  the series diverges
  - (d)  $p = 3 \Rightarrow$  the series converges
- 57. (a) From Fig. 10.11 (a) in the text with  $f(x) = \frac{1}{x}$  and  $a_k = \frac{1}{k}$ , we have  $\int_1^{n+1} \frac{1}{x} dx \le 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$   $\le 1 + \int_1^n f(x) dx \Rightarrow \ln(n+1) \le 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \le 1 + \ln n \Rightarrow 0 \le \ln(n+1) \ln n \le \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right) \ln n \le 1$ . Therefore the sequence  $\left\{\left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}\right) \ln n\right\}$  is bounded above by 1 and below by 0.
  - (b) From the graph in Fig. 10.11 (b) with  $f(x) = \frac{1}{x}, \frac{1}{n+1} < \int_{n}^{n+1} \frac{1}{x} dx = \ln(n+1) \ln n$  $\Rightarrow 0 > \frac{1}{n+1} - \left[\ln(n+1) - \ln n\right] = \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n+1} - \ln(n+1)\right) - \left(1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} - \ln n\right).$ If we define  $a_n = 1 + \frac{1}{2} = \frac{1}{3} + \frac{1}{n} - \ln n$ , then  $0 > a_{n+1} - a_n \Rightarrow a_{n+1} < a_n \Rightarrow \{a_n\}$  is a decreasing sequence of nonnegative terms.
- 58.  $e^{-x^2} \le e^{-x}$  for  $x \ge 1$ , and  $\int_1^\infty e^{-x} dx = \lim_{b \to \infty} \left[ -e^{-x} \right]_1^b = \lim_{b \to \infty} \left( -e^{-b} + e^{-1} \right) = e^{-1} \Rightarrow \int_1^\infty e^{-x^2} dx$  converges by the Comparison Test for improper integrals  $\Rightarrow \sum_{n=0}^\infty e^{-n^2} = 1 + \sum_{n=1}^\infty e^{-n^2}$  converges by the Integral Test.
- 59. (a)  $s_{10} = \sum_{n=1}^{\infty} \frac{1}{n^3} = 1.97531986$ ;  $\int_{11}^{\infty} \frac{1}{x^3} dx = \lim_{b \to \infty} \int_{11}^{b} x^{-3} dx = \lim_{b \to \infty} \left[ -\frac{x^{-2}}{2} \right]_{11}^{b} = \lim_{b \to \infty} \left( -\frac{1}{2b^2} + \frac{1}{242} \right) = \frac{1}{242}$  and  $\int_{10}^{\infty} \frac{1}{x^3} dx = \lim_{b \to \infty} \int_{10}^{b} x^{-3} dx = \lim_{b \to \infty} \left[ -\frac{x^{-2}}{2} \right]_{10}^{b} = \lim_{b \to \infty} \left( -\frac{1}{2b^2} + \frac{1}{200} \right) = \frac{1}{200}$   $\Rightarrow 1.97531986 + \frac{1}{242} < s < 1.97531986 + \frac{1}{200} \Rightarrow 1.20166 < s < 1.20253$ 
  - (b)  $s = \sum_{n=1}^{\infty} \frac{1}{n^3} \approx \frac{1.20166 + 1.20253}{2} = 1.202095$ ; error  $\leq \frac{1.20253 1.20166}{2} = 0.000435$

$$s_{10} = \sum_{n=1}^{10} \frac{1}{n^4} = 1.082036583;$$
  $\int_{11}^{\infty} \frac{1}{x^4} dx = \lim_{b \to \infty} \int_{11}^{b} x^{-4} dx = \lim_{b \to \infty} \left[ -\frac{x^{-3}}{3} \right]_{11}^{b} = \lim_{b \to \infty} \left( -\frac{1}{3b^3} + \frac{1}{3993} \right) = \frac{1}{3993}$  and  $\int_{10}^{\infty} \frac{1}{x^4} dx = \lim_{b \to \infty} \int_{10}^{b} x^{-4} dx = \lim_{b \to \infty} \left[ -\frac{x^{-3}}{3} \right]_{10}^{b} = \lim_{b \to \infty} \left( -\frac{1}{3b^3} + \frac{1}{3000} \right) = \frac{1}{3000}$   $\Rightarrow 1.082036583 + \frac{1}{3993} < s < 1.082036583 + \frac{1}{3000} \Rightarrow 1.08229 < s < 1.08237$ 

(b) 
$$s = \sum_{n=1}^{\infty} \frac{1}{n^4} \approx \frac{1.08229 + 1.08237}{2} = 1.08233$$
; error  $\leq \frac{1.08237 - 1.08229}{2} = 0.00004$ 

61. The total area will be 
$$\sum_{n=1}^{\infty} \frac{1}{n} \left( \frac{1}{n} - \frac{1}{n+1} \right) = \sum_{n=1}^{\infty} \left( \frac{1}{n^2} - \frac{1}{n(n+1)} \right)$$
. The *p*-series  $\sum_{n=1}^{\infty} \frac{1}{n^2}$  converges to  $\frac{\pi^2}{6}$  and  $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$  converges to 1 (see Example 5). Thus we can write the area as the difference of these two values, or  $\frac{\pi^2}{6} - 1 \approx 0.64493$ .

62. The area of the *n*th trapezoid is 
$$\frac{1}{2} \left( \frac{1}{n} + \frac{1}{n+1} \right) \left( \frac{1}{n} - \frac{1}{n+1} \right) = \frac{1}{2} \left( \frac{1}{n^2} - \frac{1}{(n+1)^2} \right)$$
. The total area will be  $\frac{1}{2} \sum_{n=1}^{\infty} \left( \frac{1}{n^2} - \frac{1}{(n+1)^2} \right) = \frac{1}{2}$ , since the series telescopes and has a value of 1.

## 10.4 COMPARISON TESTS

- 1. Compare with  $\sum_{n=1}^{\infty} \frac{1}{n^2}$ , which is a convergent *p*-series since p=2>1. Both series have nonnegative terms for  $n \ge 1$ . For  $n \ge 1$ , we have  $n^2 \le n^2 + 30 \Rightarrow \frac{1}{n^2} \ge \frac{1}{n^2 + 30}$ . Then by Comparison Test,  $\sum_{n=1}^{\infty} \frac{1}{n^2 + 30}$  converges.
- 2. Compare with  $\sum_{n=1}^{\infty} \frac{1}{n^3}$ , which is a convergent *p*-series since p=3>1. Both series have nonnegative terms for  $n \ge 1$ . For  $n \ge 1$ , we have  $n^4 \le n^4 + 2 \Rightarrow \frac{1}{n^4} \ge \frac{1}{n^4 + 2} \Rightarrow \frac{n}{n^4} \ge \frac{n}{n^4 + 2} \Rightarrow \frac{1}{n^3} \ge \frac{n}{n^4 + 2} \ge \frac{n-1}{n^4 + 2}$ . For  $n \ge 1$ , we have  $0 \le \cos^2 n \le 1 \Rightarrow \frac{\cos^2 n}{n^{3/2}} \le \frac{1}{n^{3/2}}$ . Then by Comparison Test,  $\sum_{n=1}^{\infty} \frac{\cos^2 n}{n^{3/2}}$  converges.

For  $n \ge 1$ , we have  $n \cdot 3^n \ge 3^n \Rightarrow \frac{1}{n \cdot 3^n} \le \frac{1}{3^n}$ . Then by Comparison Test,  $\sum_{n=1}^{\infty} \frac{1}{n \cdot 3^n}$  converges.
- 7. Compare with  $\sum_{n=1}^{\infty} \frac{\sqrt{5}}{n^{3/2}}$ . The series  $\sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$  is a convergent p-series since  $p = \frac{3}{2} > 1$ , and the series  $\sum_{n=1}^{\infty} \frac{\sqrt{5}}{n^{3/2}}$  =  $\sqrt{5} \sum_{n=1}^{\infty} \frac{1}{n^{3/2}}$  converges by Theorem 8 part 3. Both series have nonnegative terms for  $n \ge 1$ . For  $n \ge 1$ , we have  $n^3 \le n^4 \Rightarrow 4n^3 \le 4n^4 \Rightarrow n^4 + 4n^3 \le n^4 + 4n^4 = 5n^4 \Rightarrow n^4 + 4n^3 \le 5n^4 + 20 = 5\left(n^4 + 4\right)$   $\Rightarrow \frac{n^4 + 4n^3}{n^4 + 4} \le 5 \Rightarrow \frac{n^3(n+4)}{n^4 + 4} \le 5 \Rightarrow \frac{n+4}{n^4 + 4} \le \frac{5}{n^3} \Rightarrow \sqrt{\frac{n+4}{n^4 + 4}} \le \sqrt{\frac{5}{n^3}} = \frac{\sqrt{5}}{n^{3/2}}$ . Comparison Test,  $\sum_{n=2}^{\infty} \frac{n(n+1)}{(n^2+1)(n-1)}$  diverges.

12. Compare with  $\sum_{n=1}^{\infty} \frac{1}{2^n}$ , which is a convergent geometric series, since  $|r| = \left| \frac{1}{2} \right| < 1$ . Both series have positive

- 62. Let  $-\infty < q < \infty$  and  $p \le 1$ . If q = 0, then  $\sum_{n=2}^{\infty} \frac{(\ln n)^q}{n^p} = \sum_{n=2}^{\infty} \frac{1}{n^p}$ , which is a divergent p-series. If q > 0, compare with  $\sum_{n=2}^{\infty} \frac{1}{n^p}$ , which is a divergent p-series. Then  $\lim_{n\to\infty} \frac{(\ln n)^q}{n^p} = \lim_{n\to\infty} (\ln n)^q = \infty$ . If  $q < 0 \Rightarrow -q > 0$ , compare with  $\sum_{n=2}^{\infty} \frac{1}{n^r}$ , where  $0 . <math>\lim_{n\to\infty} \frac{(\ln n)^q}{n^p} = \lim_{n\to\infty} \frac{(\ln n)^q}{(\ln n)^{-q}} = \lim_{n\to\infty} \frac{(n p)^q}{(\ln n)^{-q}}$  since r p > 0. Apply L'Hopital's to obtain  $\lim_{n\to\infty} \frac{(r-p)n^{r-p-1}}{(-q)(\ln n)^{-q-1}(\frac{1}{n})} = \lim_{n\to\infty} \frac{(r-p)n^{r-p}}{(-q)(\ln n)^{-q-1}}$ . If  $-q 1 \le 0 \Rightarrow q + 1 \ge 0$  and  $\lim_{n\to\infty} \frac{(r-p)n^{r-p}(\ln n)^{q+1}}{(-q)(-q-1)(\ln n)^{-q-2}} = \lim_{n\to\infty} \frac{(r-p)^2n^{r-p}}{(-q)(-q-1)(\ln n)^{-q-2}} = \lim_{n\to\infty} \frac{(r-p)^2n^{r-p}}{(-q)(-q-1)(\ln n)^{q-2}} = \infty$ , otherwise, we apply L'Hopital's Rule again. Since q is finite, there is a positive integer k such that  $-q k \le 0 \Rightarrow q + k \ge 0$ . Thus, after k applications of L'Hopital's Rule we obtain  $\lim_{n\to\infty} \frac{(r-p)^k n^{r-p}}{(-q)(-q-1)\cdots(-q-k+1)(\ln n)^{-q-k}} = \lim_{n\to\infty} \frac{(n-p)^k n^{r-p}}{(-q)(-q-1)\cdots(-q-k+1)(\ln n)^{-q-k}} = \lim_{n\to\infty} \frac{(n-p)^k n^{r-p}}{(-q)(-q-1)\cdots(-q-k+1)(n-q-k)} = \lim_{n\to\infty} \frac{(n-p)^k n^{r-p}}{(-q)(-q-1)\cdots$
- 63. Since  $0 \le d_n \le 9$  for all n and the geometric series  $\sum_{n=1}^{\infty} \frac{9}{10^n}$  converges to 1,  $\sum_{n=1}^{\infty} \frac{d_n}{10^n}$  converges.
- 64. Since  $\sum_{n=1}^{\infty} a_n$  converges,  $a_n \to 0$  as  $n \to \infty$ . Thus for all n greater than some N we have  $0 < a_n < \frac{\pi}{2}$  and thus  $0 < \sin a_n < a_n$ . Thus  $\sum_{n=1}^{\infty} \sin a_n$  converges by Theorem 10.

- 72. (a) Let  $S = \sum_{n=1}^{\infty} \frac{1}{n^2}$ , which is a convergent *p*-series By Example 5 in Section 10.2,  $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$  converges to 1. By Theorem 8,  $S = \sum_{n=1}^{\infty} \frac{1}{n^2} = \sum_{n=1}^{\infty} \frac{1}{n(n+1)} + \sum_{n=1}^{\infty} \frac{1}{n^2} \sum_{n=1}^{\infty} \frac{1}{n(n+1)} = \sum_{n=1}^{\infty} \frac{1}{n(n+1)} + \sum_{n=1}^{\infty} \left(\frac{1}{n^2} \frac{1}{n(n+1)}\right)$  also converges.
  - (b) Since  $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$  converges to 1 (from Example 5 in Section 10.2),  $S = 1 + \sum_{n=1}^{\infty} \left(\frac{1}{n^2} \frac{1}{n(n+1)}\right) = 1 + \sum_{n=1}^{\infty} \frac{1}{n^2(n+1)}$
  - (c) The new series is comparable to  $\sum_{n=1}^{\infty} \frac{1}{n^3}$ , so it will converge faster because its terms  $\to 0$  faster than the terms of  $\sum_{n=1}^{\infty} \frac{1}{n^2}$ .
  - (d) The series  $1 + \sum_{n=1}^{1000} \frac{1}{n^2(n+1)}$  gives a better approximation. Using Mathematica,  $1 + \sum_{n=1}^{1000} \frac{1}{n^2(n+1)} = 1.644933568$ , while  $\sum_{n=1}^{1000000} \frac{1}{n^2} = 1.644933067$ . Note that  $\frac{\pi^2}{6} = 1.644934067$ . The error is  $4.99 \times 10^{-7}$  compared with  $1 \times 10^{-6}$ .

- 63. Theorem 16 states that  $\sum_{n=1}^{\infty} |a_n|$  converges  $\Rightarrow \sum_{n=1}^{\infty} a_n$  converges. But this is equivalent to  $\sum_{n=1}^{\infty} a_n$  diverges  $\Rightarrow \sum_{n=1}^{\infty} |a_n|$  diverges
- 64.  $|a_1 + a_2 + ... + a_n| \le |a_1| + |a_2| + ... + |a_n|$  for all n; then  $\sum_{n=1}^{\infty} |a_n|$  converges  $\Rightarrow \sum_{n=1}^{\infty} a_n$  converges and these imply that  $\left|\sum_{n=1}^{\infty} a_n\right| \le \sum_{n=1}^{\infty} |a_n|$
- 65. (a)  $\sum_{n=1}^{\infty} |a_n + b_n|$  converges by the Direct Comparison Test since  $|a_n + b_n| \le |a_n| + |b_n|$  and hence  $\sum_{n=1}^{\infty} (a_n + b_n)$  converges absolutely
  - (b)  $\sum_{n=1}^{\infty} |b_n|$  converges  $\Rightarrow \sum_{n=1}^{\infty} -b_n$  converges absolutely; since  $\sum_{n=1}^{\infty} a_n$  converges absolutely and  $\sum_{n=1}^{\infty} -b_n$  converges absolutely, we have  $\sum_{n=1}^{\infty} [a_n + (-b_n)] = \sum_{n=1}^{\infty} (a_n b_n)$  converges absolutely by part (a)
  - (c)  $\sum_{n=1}^{\infty} |a_n|$  converges  $\Rightarrow |k| \sum_{n=1}^{\infty} |a_n| = \sum_{n=1}^{\infty} |ka_n|$  converges  $\Rightarrow \sum_{n=1}^{\infty} ka_n$  converges absolutely

66. If 
$$a_n = b_n = (-1)^n \frac{1}{\sqrt{n}}$$
, then  $\sum_{n=1}^{\infty} (-1)^n \frac{1}{\sqrt{n}}$  converges, but  $\sum_{n=1}^{\infty} a_n b_n = \sum_{n=1}^{\infty} \frac{1}{n}$  diverges

- 67. Since  $\sum_{n=1}^{\infty} a_n$  converges,  $a_n \to 0$  and for all n greater than some N,  $|a_n| < 1$  and  $(a_n)^2 < |a_n|$ . Since  $\sum_{n=1}^{\infty} a_n$  is absolutely convergent,  $\sum_{n=1}^{\infty} |a_n|$  converges and thus  $\sum_{n=1}^{\infty} (a_n)^2$  converges by the Direct Comparison Test.
- 68. For n > 2,  $\frac{1}{n} \frac{1}{n^2} > \frac{1}{2n}$ . Thus  $\sum_{n=1}^{\infty} \left( \frac{1}{n} \frac{1}{n^2} \right)$  diverges by comparison with the divergent harmonic series.

$$\begin{split} 69. \quad & s_1 = -\frac{1}{2}, s_2 = -\frac{1}{2} + 1 = \frac{1}{2}, \\ & s_3 = -\frac{1}{2} + 1 - \frac{1}{4} - \frac{1}{6} - \frac{1}{8} - \frac{1}{10} - \frac{1}{12} - \frac{1}{14} - \frac{1}{16} - \frac{1}{18} - \frac{1}{20} - \frac{1}{22} \approx -0.5099, \\ & s_4 = s_3 + \frac{1}{3} \approx -0.1766, \\ & s_5 = s_4 - \frac{1}{24} - \frac{1}{26} - \frac{1}{28} - \frac{1}{30} - \frac{1}{32} - \frac{1}{34} - \frac{1}{36} - \frac{1}{38} - \frac{1}{40} - \frac{1}{42} - \frac{1}{44} \approx -0.512, \\ & s_6 = s_5 + \frac{1}{5} \approx -0.312, \\ & s_7 = s_6 - \frac{1}{46} - \frac{1}{48} - \frac{1}{50} - \frac{1}{52} - \frac{1}{54} - \frac{1}{56} - \frac{1}{58} - \frac{1}{60} - \frac{1}{62} - \frac{1}{64} - \frac{1}{66} \approx -0.51106 \end{split}$$

70. (a) Since  $\sum |a_n|$  converges, say to M, for  $\epsilon > 0$  there is an integer  $N_1$  such that

$$\left|\sum_{n=1}^{N_1-1}\left|a_n\right|-M\right|<\frac{\epsilon}{2} \Leftrightarrow \left|\sum_{n=1}^{N_1-1}\left|a_n\right|-\left(\sum_{n=1}^{N_1-1}\left|a_n\right|+\sum_{n=N_1}^{\infty}\left|a_n\right|\right)\right|<\frac{\epsilon}{2} \Leftrightarrow \left|-\sum_{n=N_1}^{\infty}\left|a_n\right|<\frac{\epsilon}{2} \Leftrightarrow \sum_{n=N_1}^{\infty}\left|a_n\right|<\frac{\epsilon}{2}.$$

Also,  $\sum a_n$  converges to  $L \Leftrightarrow$  for  $\epsilon > 0$  there is an integer  $N_2$  (which we can choose greater than or equal to  $N_1$ ) such that  $\left|s_{N_2} - L\right| < \frac{\epsilon}{2}$ . Therefore,  $\sum_{n=N_1}^{\infty} \left|a_n\right| < \frac{\epsilon}{2}$  and  $\left|s_{N_2} - L\right| < \frac{\epsilon}{2}$ .

(b) The series  $\sum_{n=1}^{\infty} |a_n|$  converges absolutely, say to M. Thus, there exists  $N_1$  such that  $\left|\sum_{n=1}^{k} |a_n| - M\right| < \epsilon$  whenever  $k > N_1$ . Now all of the terms in the sequence  $\{|b_n|\}$  appear in  $\{|a_n|\}$ . Sum together all of the terms in  $\{|b_n|\}$ , in order, until you include all of the terms  $\{|a_n|\}_{n=1}^{N_1}$ , and let  $N_2$  be the largest index in the sum  $\sum_{n=1}^{N_2} |b_n|$  so obtained. Then  $\left|\sum_{n=1}^{N_2} |b_n| - M\right| < \epsilon$  as well  $\Rightarrow \sum_{n=1}^{\infty} |b_n|$  converges to M.

- (c) there are no values for which the series converges conditionally

21. First, rewrite the series as 
$$\sum_{n=1}^{\infty} \left(2 + (-1)^n\right) (x+1)^{n-1} = \sum_{n=1}^{\infty} 2(x+1)^{n-1} + \sum_{n=1}^{\infty} (-1)^n (x+1)^{n-1}.$$

For the series 
$$\sum_{n=1}^{\infty} 2(x+1)^{n-1}$$
:  $\lim_{n\to\infty} \left| \frac{u_{n+1}}{u_n} \right| < 1 \Rightarrow \lim_{n\to\infty} \left| \frac{2(x+1)^n}{2(x+1)^{n-1}} \right| < 1 \Rightarrow |x+1| \lim_{n\to\infty} 1 = |x+1| < 1 \Rightarrow -2 < x < 0;$ 

For the series 
$$\sum_{n=1}^{\infty} (-1)^n (x+1)^{n-1} : \lim_{n \to \infty} \left| \frac{u_{n+1}}{u_n} \right| < 1 \Rightarrow \lim_{n \to \infty} \left| \frac{(-1)^{n+1} (x+1)^n}{(-1)^n (x+1)^{n-1}} \right| < 1 \Rightarrow |x+1| \lim_{n \to \infty} 1 = |x+1| < 1$$

- 49. Writing  $\frac{2}{x}$  as  $\frac{2}{1-[-(x-1)]}$  we see that it can be written as the power series  $\sum_{n=0}^{\infty} 2[-(x-1)]^n = \sum_{n=0}^{\infty} 2(-1)^n (x-1)^n$ . Since this is a geometric series with ratio -(x-1) it will converge for |-(x-1)| < 1 or 0 < x < 2.
- 50. (a)  $f(x) = \frac{5}{3-x} = \frac{5/3}{1-(x/3)} = \sum_{n=0}^{\infty} \frac{5}{3} \left(\frac{x}{3}\right)^n$ , which converges for  $\left|\frac{x}{3}\right| < 1$  or  $\left|x\right| < 3$ . , which converges for  $\left|\frac{x-5}{3}\right| < 1 \text{ or } 2 < x < 8$ .

- 52. (a) We can write the given series as  $\frac{1}{2} \sum_{n=0}^{\infty} \left(\frac{x}{4}\right)^n$  which shows that the interval of convergence is -4 < x < 4.
  - (b) The function represented by the series in (a) is  $\frac{2}{4-x}$  for -4 < x < 4. If we rewrite this function as  $\frac{2}{1-(x-3)}$  we can represent it by the geometric series  $\sum_{n=0}^{\infty} 2(x-3)^n$  which will converge only for |x-3| < 1 or 2 < x < 4.
- 53.  $\lim_{n\to\infty} \left| \frac{(x-3)^{n+1}}{2^{n+1}} \cdot \frac{2^n}{(x-3)^n} \right| < 1 \Rightarrow |x-3| < 2 \Rightarrow 1 < x < 5; \text{ when } x = 1 \text{ we have } \sum_{n=0}^{\infty} (1)^n \text{ which diverges; when } x = 5$ we have  $\sum_{n=1}^{\infty} (-1)^n \text{ which also diverges; the interval of convergence is } 1 < x < 5; \text{ the sum of this convergent}$ geometric series is  $\frac{1}{1+\left(\frac{x-3}{2}\right)} = \frac{2}{x-1}. \text{ If } f(x) = 1 \frac{1}{2}(x-3) + \frac{1}{4}(x-3)^2 + \dots + \left(-\frac{1}{2}\right)^n (x-3)^n + \dots = \frac{2}{x-1} \text{ then}$   $f'(x) = -\frac{1}{2} + \frac{1}{2}(x-3) + \dots + \left(-\frac{1}{2}\right)^n n(x-3)^{n-1} + \dots \text{ is convergent when } 1 < x < 5, \text{ and diverges when } x = 1 \text{ or } 5.$ The sum for f'(x) is  $\frac{-2}{(x-1)^2}$ , the derivative of  $\frac{2}{x-1}$ .
- 54. If  $f(x) = 1 \frac{1}{2}(x 3) + \frac{1}{4}(x 3)^2 + \dots + \left(-\frac{1}{2}\right)^n (x 3)^n + \dots = \frac{2}{x 1}$  then  $\int f(x) \, dx = x \frac{(x 3.)^2}{4} + \frac{(x 3)^3}{12} + \dots + \left(-\frac{1}{2}\right)^n \frac{(x 3)^{n + 1}}{n + 1} + \dots$  At x = 1 the series  $\sum_{n = 1}^{\infty} \frac{-2}{n + 1}$  diverges; at x = 5 the series  $\sum_{n = 1}^{\infty} \frac{(-1)^n 2}{n + 1}$  converges. Therefore the interval of convergence is  $1 < x \le 5$  and the sum is  $2 \ln |x 1| + (3 \ln 4)$ , since  $\int \frac{2}{x 1} \, dx = 2 \ln |x 1| + C$ , where  $C = 3 \ln 4$  when x = 3.

- 45. A special case of Taylor's Theorem is f(b) = f(a) + f'(c)(b-a), where c is between a and  $b \Rightarrow f(b) f(a) = f'(c)(b-a)$ , the Mean Value Theorem.
- 46. If f(x) is twice differentiable and at x = a there is a point of inflection, then f''(a) = 0. Therefore, L(x) = Q(x) = f(a) + f'(a)(x a).
- 47. (a)  $f'' \le 0$ , f'(a) = 0 and x = a interior to the interval  $I \Rightarrow f(x) f(a) = \frac{f''(c_2)}{2}(x a)^2 \le 0$  throughout  $I \Rightarrow f(x) \le f(a)$  throughout  $I \Rightarrow f$  has a local maximum at x = a
  - (b) similar reasoning gives  $f(x) f(a) = \frac{f''(c_2)}{2}(x-a)^2 \ge 0$  throughout  $I \Rightarrow f(x) \ge f(a)$  throughout  $I \Rightarrow f$  has a local minimum at x = a

48. 
$$f(x) = (1-x)^{-1} \Rightarrow f'(x) = (1-x)^{-2} \Rightarrow f''(x) = 2(1-x)^{-3} \Rightarrow f^{(3)}(x) = 6(1-x)^{-4} \Rightarrow f^{(4)}(x) = 24(1-x)^{-5};$$
therefore  $\frac{1}{1-x} \approx 1 + x + x^2 + x^3$ .  $|x| < 0.1 \Rightarrow \frac{10}{11} < \frac{1}{1-x} < \frac{10}{9} \Rightarrow \left| \frac{1}{(1-x)^5} \right| < \left( \frac{10}{9} \right)^5 \Rightarrow \left| \frac{x^4}{(1-x)^5} \right| < x^4 \left( \frac{10}{9} \right)^5 \Rightarrow \text{ the error}$ 

$$e_3 \le \left| \frac{\max f^{(4)}(x)x^4}{4!} \right| < (0.1)^4 \left( \frac{10}{9} \right)^5 = 0.00016935 < 0.00017, \text{ since } \left| \frac{f^{(4)}(x)}{4!} \right| = \left| \frac{1}{(1-x)^5} \right|.$$

49. (a) 
$$f(x) = (1+x)^k \Rightarrow f'(x) = k(1+x)^{k-1} \Rightarrow f''(x) = k(k-1)(1+x)^{k-2}$$
;  $f(0) = 1$ ,  $f'(0) = k$ , and  $f''(0) = k(k-1) \Rightarrow Q(x) = 1 + kx + \frac{k(k-1)}{2}x^2$ 

(b) 
$$|R_2(x)| = \left| \frac{3 \cdot 2 \cdot 1}{3!} x^3 \right| < \frac{1}{100} \Rightarrow \left| x^3 \right| < \frac{1}{100} \Rightarrow 0 < x < \frac{1}{100^{1/3}} \text{ or } 0 < x < .21544$$

50. (a) Let 
$$P = x + \pi \Rightarrow |x| = |P - \pi| < .5 \times 10^{-n}$$
 since  $P$  approximates  $\pi$  accurate to  $n$  decimals. Then,  $P + \sin P = (\pi + x) + \sin(\pi + x) = (\pi + x) - \sin x = \pi + (x - \sin x)$ 

$$\Rightarrow |(P + \sin P) - \pi| = |\sin x - x| \le \frac{|x|^3}{3!} < \frac{0.125}{3!} \times 10^{-3n} < 0.5 \times 10^{-3n} \Rightarrow P + \sin P \text{ gives an approximation to } \pi \text{ correct to } 3n \text{ decimals.}$$

51. If 
$$f(x) = \sum_{n=0}^{\infty} a_n x^n$$
, then  $f^{(k)}(x) = \sum_{n=k}^{\infty} n(n-1)(n-2)\cdots(n-k+1)a_n x^{n-k}$  and  $f^{(k)}(0) = k!a_k \Rightarrow a_k = \frac{f^{(k)}(0)}{k!}$  for  $k$  a nonnegative integer. Therefore, the coefficients of  $f(x)$  are identical with the corresponding coefficients in the Maclaurin series of  $f(x)$  and the statement follows.

52. Note: 
$$f \text{ even } \Rightarrow f(-x) = f(x) \Rightarrow -f'(-x) = f'(x) \Rightarrow f'(-x) = -f'(x) \Rightarrow f' \text{ odd};$$

$$f \text{ odd } \Rightarrow f(-x) = -f(x) \Rightarrow -f'(-x) = -f'(x) \Rightarrow f'(-x) = f'(x) \Rightarrow f' \text{ even};$$

$$\text{also, } f \text{ odd } \Rightarrow f(-0) = f(0) \Rightarrow 2f(0) = 0 \Rightarrow f(0) = 0$$

- (a) If f(x) is even, then any odd-order derivative is odd and equal to 0 at x = 0. Therefore,  $a_1 = a_3 = a_5 = ... = 0$ ; that is, the Maclaurin series for f contains only even powers.
- (b) If f(x) is odd, then any even-order derivative is odd and equal to 0 at x = 0. Therefore,  $a_0 = a_2 = a_4 = \dots = 0$ ; that is, the Maclaurin series for f contains only odd powers.

- 15. Example 3 gives the indefinite integral as  $C + \frac{x^3}{3} \frac{x^7}{7 \cdot 3!} + \frac{x^{11}}{11 \cdot 5!} \frac{x^{15}}{15 \cdot 7!} + \cdots$ . Since the lower limit of integration is 0, the value of the definite integral will be the value of this series at the upper limit, with C = 0. Since  $\frac{0.6^{11}}{11 \cdot 5!} \approx 2.75 \times 10^{-6}$  and the preceding term is greater than  $10^{-5}$ , the first two terms should give the required accuracy, and the integral is approximated to within  $10^{-5}$  by  $\frac{0.6^3}{3} \frac{0.6^7}{7 \cdot 3!} \approx 0.0713335$
- 16. Using the series for  $e^{-x}$ , we find  $\frac{e^{-x}-1}{x} = -1 + \frac{x}{2!} \frac{x^2}{3!} + \cdots$ . Integrating term by term and noting that the lower limit of integration is 0, the value of the definite integral from 0 to x is given by  $-x + \frac{x^2}{2 \cdot 2!} \frac{x^3}{3 \cdot 3!} + \cdots$ . Since  $\frac{0.4^6}{6 \cdot 6!} \approx 9.48 \times 10^{-7}$  and the preceding term is greater than  $10^{-5}$ , the first five terms should give the required accuracy, and the integral is approximated to within  $10^{-5}$  by  $-0.4 + \frac{0.4^2}{2 \cdot 2!} \frac{0.4^3}{3 \cdot 3!} + \frac{0.4^4}{4 \cdot 4!} \frac{0.4^5}{5 \cdot 5!} \approx -0.3633060$ .

Since  $\frac{5 \cdot 0.5^{13}}{13 \cdot 16} \approx 2.93 \times 10^{-6}$  and the preceding term is greater than  $10^{-5}$ , the first three terms should give the required accuracy, and the integral is approximated to within  $10^{-5}$  by  $0.5 \frac{0.5^5}{10} + \frac{0.5^9}{24} \approx 0.4969564$ .
- 18. Using a binomial series we find  $\sqrt[3]{1+x^2} = 1 + \frac{x^2}{3} \frac{x^4}{9} + \frac{5x^6}{81} \cdots$ . Since  $\frac{5 \cdot 0.35^7}{7 \cdot 81} \approx 5.67 \times 10^{-6}$  and the preceding term is greater than  $10^{-5}$ , the first three terms should give the required accuracy, and the integral is approximated to within  $10^{-5}$  by  $0.35 + \frac{0.35^3}{9} \frac{0.35^5}{45} \approx 0.3546472$ .

At n = 1929 we obtain the first approximation accurate to 3 decimals: 3.141999845. At n = 30,000 we still do not obtain accuracy to 4 decimals: 3.141617732, so the convergence to  $\pi$  is very slow. Here is a Maple CAS procedure to produce these approximations:

```
