Barick Chung

Employment:
2014-present Senior Lecturer, Department of Economics, CUSZ – Shenzhen.
2012-2014 Lecturer, School of Economics and Finance, University of Hong Kong.
2006-2012 Instructor, Department of Economics, CUHK – Hong Kong.

Education:
2003-2007 Ph.D. (Business) Indiana University – Bloomington.
1987-1991 BS.Sc. (Economics) Chinese University of Hong Kong – Hong Kong.

Research paper:
Chung, Barick, "Two Level Price Discrimination and Vertical Relationship" (March 05, 2012). Available at SSRN: http://ssrn.com/abstract=1997070.

MRS

Pindyck and Rubinfeld, p.218:

Marginal rate of technical substitution (MRTS): Amount by which the quantity of one input can be reduced when one extra unit of another input is used, so that output remains constant.

$MRTS_{LK}$ = − Change in capital input / change in labor input

= − $\Delta K / \Delta L$

Definition

2:46:39   3

Isoquant: Curve showing all possible combinations of inputs that yield the same output.

Capital

```
6
5
4
3
2        Q₃ = 90
1
O
   1  2  3  4  5  6  7  8   Labor
```

$Q_3 = 90$

Pindyck and Rubinfeld, p. 219:

Diminishing MRTS: The MRTS falls as we move down along an isoquant. In other words, isoquants are convex.
Assumption

product / output / return

---

2 special cases

Special case #1

Special case #1: Isoquants when inputs are **prefect substitutes**.

Capital

MRTS = 1

MRTS = 1

Labor

Special case #2

Special case #2: Isoquants with **Fixed-proportion** production function.

Capital

$MRTS = +\infty$

$MRTS = 0$

Q2

K1

Q1

L1

Labor

L
Iso-cost line

Pindyck and Rubinfeld, p.245:

$C = w - L + r \cdot k$

Isocost line: Graph showing all possible combinations of labor and capital that can be purchased for a given total cost.

$C = w \times L + r \times K$ Isocost equation

where w is wage rate of labor and r is rent of capital

Rewrite:

$K = C / r - (w / r) L$ Isocost line

Slope of isocost line is $\Delta K / \Delta L = - (w / r)$ (w / r is called **relative input price**)

$K = \dfrac{C}{r} - \dfrac{w}{r} \cdot L$

2:46:39   10

$\text{slope} = -\dfrac{w}{r}$

2:46:39   11

Tangency

(i) slope of isocost
(ii) Tangency

$-MP_L = -\dfrac{w}{r} \text{slope of isoq} = -MRTS$

$\dfrac{MP_L}{MP_K}$ A $Q = Q_0$

$\dfrac{MP_L}{W} = \dfrac{MP_K}{r}$

2:46:39   12

Pindyck and Rubinfeld, p. 219:

Returns to scale: Rate at which output increases as inputs are increased proportionately.

**Increasing returns to scale**: Situation in which output more than doubles when all inputs are doubled.

Constant returns to scale: Situation in which output doubles when all inputs are doubled.

Decreasing returns to scale: Situation in which output less than doubles when all inputs are doubled.

L

$\overline{k} > k^*$

(ii) $\overline{k} = k^*$

$\overline{k} < k^*$

Pindyck and Rubinfeld, pp.206 – 7:

Average product: Output per unit of a particular input.

Marginal product: Additional output produced as an input is increased by one unit.

Definitions

Pindyck and Rubinfeld, pp.206 – 7:

$$\frac{Q}{L}$$

Average product of labor = Output / labor input = Q / L

Marginal product of labor = Change in output / change in labor input = $\triangle Q / \triangle L$

$$\frac{Q}{K}$$

Average product of capital = Output / capital input = Q / K

Marginal product of capital = Change in output / change in capital input = $\triangle Q / \triangle K$

Definitions

2:46:39   16

Pindyck and Rubinfeld, pp.206–7:

Labor L	Capital K	Output Q	$AP_L = Q/L$	$MP_L = \triangle Q/\triangle L$	$AP_K = Q / K$	$MP_K = \triangle Q / \triangle K$
0	10	0	-	-
